BB4 7RT

Contract No: 40370

Date: June 2008

EXECUTIVE SUMMARY

On the instructions of Eric Wright Construction a Phase 1 Desk Study was carried out at the site of a proposed NHS Lift Project adjacent to the existing Clitheroe Hospital

The desk study was carried out to assess the potential hazards on and adjacent to the site and prepare a risk assessment for further consideration

The geological map indicates the site to be underlain by superficial deposits of Boulder Clay. The superficial deposits are underlain by Worston Shale Group of Lower Carboniferous age

The desk study has indicated that the site has not previously been developed

The desk study has not identified a significant risk to site workers, end users or the water environment

As part of an investigation to determine geotechnical design parameters a prudent developer should consider carrying out a limited programme of sampling and analysis of soil and water samples to confirm the findings of the desk study

1.0 INTRODUCTION

- 1.1 It is understood that it is proposed to develop the site for new hospital facilities
- 1.2 On the instructions of Booth King Partnership, acting on behalf of Eric Wright Construction a Phase 1 Desk Study has been carried out in order to assess the potential hazards on and adjacent to the site and prepare a risk assessment for further consideration
- 1.3 This report has been prepared for the sole use of the Client for the purpose described and no extended duty of care to any third party is implied or offered. Third parties using any information contained within this report do so at their own risk
- 1.4 It is recommended that a copy of this report be submitted to the relevant authorities to enable them to carry out their own site assessment and provide any comments
- 1.5 The comments given in this report and the opinions expressed herein are based on the information obtained from the desk study and site reconnaissance. No intrusive investigation has been carried out to confirm the actual ground or environmental conditions
- 1.6 Any risks identified in this desk study are perceived risks based on information reviewed. Actual risks can only be assessed following a physical investigation of the site
- 1.7 This report has been based, in part, on information supplied by others. The report has been prepared on the basis of that information being accurate
- 1.8 The conclusions presented in this report are based on the guidance available at the time of preparation of the report. No liability can be accepted for the retrospective effects of any changes or amendments to legislation or guidance
- 1.9 This Phase 1 Desk Study has been conducted in general accordance with CLR 3, ref 9 1 and CLR 11, ref 9 2

2.0 SITE

2.1 Site Location

- 2.1.1 The site is situated approximately 1.5 km to the northeast of the town centre of Clitheroe and may be located by National Grid Reference 375540, 443060. A site location plan is included in Appendix 1, Figure A1.1

2.2 Site Description

- 2.2.1 A walkover survey of the site was conducted on 21st May 2008. The walkover was carried out in general accordance with CLR 2, ref 9 3

- 2 2 2 The site comprises an approximately rectangular area of land with overall dimensions of about 80m by 120m The site is elongated from northwest to southeast
- 2 2 3 The site is bounded to the northwest by the A671 Chatburn Road, to the northeast by the A671 Pimlico Link Road, to the southwest by Clitheroe hospital and to the southeast by adjacent agricultural land
- 2 2 4 The site comprises an area of sensibly level arable land
- 2 2 5 A small concrete tank structure was present towards the northwest end of the site.
- 2 2 6 A site plan is included in Appendix 1, Figure A1 2

2 3 Historical Maps

- 2 3 1 A review of the history of the site has been conducted based on readily available historical maps Selected maps are included in Appendix 1

Figure N° Date & Scale	On Site	Site Surroundings
Fig. No. A1.3 1847 1:10,560	The site comprises an area of agricultural land in a rural environment The site is bounded to the northwest by a road and by adjacent agricultural land on all other sides The site appears to be bisected by a field boundary or ditch running from northwest to southeast.	The site is surrounded by a ring of limestone quarries between about 500m and 800m from the site boundary
Fig. No. A1.4 1890 1:10,560 and A1.5 1886 1:2,500	There are little or no significant changes to the site since the previously published map.	The area immediately to the southwest of the site is now occupied by the Clitheroe Union Workhouse The development of the local quarrying industry has continued with associated lime and cement works some 500m to the northwest and northeast of the site The Blackburn Railway has been developed some 200m to the northwest of the site.
Fig. No. A1.6 1914 1:10,560 and A1.7 1912 1:2,500	A small tank structure is marked towards the northwest end of the site otherwise there are little or no significant changes to the site since the previously published map.	A mineral railway has been developed to the northeast and southeast of the site, some 50-60m from the boundary, linking the Salthill Quarry, to the southwest, to the Bellmanpark Lime works to the northeast

Fig. No. A1.8 1955 1:10,560	There are little or no significant changes to the site or surrounding area since the previously published map. A small building is present on the southwest boundary of the site.	The adjacent site is now referred to as Clitheroe Hospital
Fig. No. A1.9 1964-1965 1:2,500	The field boundary / ditch formerly bisecting the site is no longer evident otherwise there are little or no significant changes to the site since the previously published map.	The mineral railway to the northeast and southeast has been removed although the line of the cuttings are still evident and may have been adapted to use as a road to the northeast of the site
Fig. No. A1.10 1970 - 1977 1:2,500 and A1.11 1972 - 1977 1:10,000	There are little or no significant changes to the site since the previously published map	The A671 has been developed adjacent to the northeast boundary of the site. To the north of the site and to the north of the railway line a large quarry is present merged fro the Lanehead, Bold Venture and Bankfield limestone quarries. A large works associated with these quarries is present at Horrocksford, some 1km to the northwest of the site.
Fig. No. A1.12 1979 - 1989 1:2,500	There are little or no significant changes to the site or surrounding area since the previously published map.	
Fig. No. A1.13 1994 1:2,500	There are little or no significant changes to the site or surrounding area since the previously published map.	
Fig. No. A1.14 2001 1:10,000	There are little or no significant changes to the site or surrounding area since the previously published map.	
Fig. No. A1.15 2008 1:10,000	There are little or no significant changes to the site or surrounding area since the previously published map.	Development has taken place to the south of the site

3.0 SITE SETTING

3.1 Geological Setting

- 3.1.1 Details of the geology underlying the site have been obtained from the British Geological Survey map, Sheet No 68, 'Clitheroe', drift edition, 1:50,000 scale, published 1975
- 3.1.2 The geological map indicates the site to be underlain by superficial deposits of Boulder Clay
- 3.1.3 The superficial deposits are underlain by Worston Shale Group of Lower Carboniferous age

- 3 1 4 Although not indicated as present on the site from the geological maps, the possibility that Made Ground exists on site cannot be discounted

3.2 Hydrogeological Setting

- 3 2 1 The hydrogeological records indicate that the site is located upon a minor aquifer, namely the Carboniferous Limestone.
- 3 2 2 The Environment Agency defines a minor aquifer as 'being of variable permeability. These can be fractured or potentially fractured rocks that do not have a high primary permeability, or other formations of variable permeability including unconsolidated deposits. Although not producing large quantities of water for abstraction, they are important for local supplies and in supplying base flow to rivers'.
- 3 2 3 The Envirocheck vulnerability map indicates the soil to be of low leaching potential
- 3 2 4 Soils of low leaching potential are soils in which pollutants are unlikely to penetrate the soil layer because water movement is largely horizontal or they have large ability to attenuate diffuse pollutants. Lateral flow from these soils contributes to groundwater recharge elsewhere in the catchment
- 3 2 5 The site is not located within a groundwater source protection zone
- 3 2 6 There are three groundwater abstraction wells within 1km of the site. The nearest groundwater abstraction borehole lies some 336m to the southeast of the site and is used for industrial / commercial / public services: general use

3.3 Hydrological Setting

- 3 3 1 The nearest surface watercourse is a drain some 100m to the northwest of the site. A pond is located immediately to the southeast of the site
- 3 3 2 The surface waters are at approximately the same level as the site
- 3 3 3 The site is not located within a river floodplain area and is therefore not likely to be subject to flood warnings
- 3 3 4 There is no available river quality classification data for the nearest watercourse
- 3 3 5 There are no surface water abstractions within 1km of the site

3.4 Radon

- 3 4 1 The National Radiological Protection Board, ref 9 6, indicates the site to lie within an area where there is a probability of 1% to 3% of present or future

homes being above the action level of 200Bq/m³. As such, the site is classified as a Radon Affected Area.

- 3.4.2 The Envirocheck report also indicates that no radon protection measures are required which appears contradictory to the classification
- 3.4.3 Clarification should be sought from local building control as to the measures required in this area

4.0 GEOLOGICAL CONSIDERATIONS

4.1 Geological Constraints

- 4.1.1 The following are brief findings relating to factors highlighted in the Envirocheck report that may have a potential impact upon the engineering of the proposed development

Potential Hazard	Recorded Risk	
	On - site	Off – site (distance / direction)
Coal mining	None	
Shallow mine workings	None	
Compressible ground subsidence	None	
Ground dissolution subsidence	Very low	
Running sand subsidence	None	
Shrinking or swelling clay subsidence	Very low	
Landslip subsidence	Very low	
Anticipated thickness of Made Ground?	Absent / very thin	

5.0 ENVIRONMENTAL SEARCHES

5.1 Registered / Historical Landfill Sites

- 5.1.1 There is one historic landfill site within 500m of the site
- 5.1.2 The historical landfill is located some 370m to the southeast of the site at the former Salthills quarry

5.2 Licensed Waste Management Facilities

- 5.2.1 There are two licensed waste management facilities within 500m of the site
- 5.2.2 The nearest licensed waste management facility is located some 244m to the west of the site at the former Coplow Quarry

5.3 Radioactive Sources

5.3.1 There are no Radioactive Source Authorisations issued within 500m of the site

5.4 Hazardous Substances

5.4.1 There are no recorded sites listed under hazardous substances regulations within 500m of the site.

5.5 Pollution Incidents to Controlled Waters

5.5.1 There are no recorded pollution incidents within 500m of the site

5.6 Discharge Consents to Controlled Waters

5.6.1 There is one recorded discharge consents to controlled waters within 500m of the site

5.6.2 The nearest discharge consent to controlled waters is 456m to the northeast of the site

5.6.3 The consent relates to process water discharging to a stream

5.7 Green Belt Areas

5.7.1 There are no designated areas or as yet un-adopted areas of Green Belt land within 1km of the site

5.8 Designated Sites

5.8.1 A review of the English Nature website was undertaken to assess whether there were any Sites of Special Scientific Interest (SSSI), National Nature Reserves (NNR) or Local Nature Reserves (LNR) which may be impacted by the development

5.8.2 The enquiries indicated there are four SSSIs, within 500m of the site. These designations relate to geological conservation of quarries

5.9 Nitrate Vulnerable Zone

5.9.1 The site is located within an area designated as a nitrate vulnerable zone

5.9.2 The Nitrates Directive defines a nitrate vulnerable zone as:

- a) Surface freshwater which contains or could contain, if preventative action is not taken, nitrate concentrations greater than 50mg/l
- b) Groundwater which contains or could contain, if preventative action is not taken, nitrate concentrations greater than 50mg/l

- c) Natural freshwater lakes or other freshwater bodies, estuaries, coastal waters and marine waters, which are eutrophic or may become so in the near future if protective action is not taken

5.10 Contemporary Trade Entries

- 5.10.1 There are fourteen contemporary trade entries located within 250m of the site
- 5.10.2 The nearest contemporary trade entries reflect the retail / commercial and light industrial land uses in the vicinity of the site
- 5.10.3 There are no fuel station entries within 500m of the site

6.0 CONCEPTUAL SITE MODEL

6.1 Contaminated Land

- 6.1.1 The statutory definition of contaminated land is defined in the Environmental Protection Act 1990, ref 9.8, which was introduced by the Environment Act 1995, ref 9.9, as;
- ‘Land which appears to the Local Authority in whose area it is situated to be in such a condition, by reason of substances in, on or under the land, that –
 - significant harm is being caused or there is a significant possibility of such harm being caused; or
 - significant pollution of controlled waters is being, or there is a significant possibility of such pollution being caused’

6.2 Risk Assessment

- 6.2.1 The definition of contaminated land is based on the principles of risk assessment. Risk is defined as a combination of:
- The probability, or frequency, of exposure to a substance with the potential to cause harm, and;
 - The seriousness of the consequence

6.3 Pollutant Linkage

- 6.3.1 The basis of an environmental risk assessment involves identifying a ‘source’ of contamination, a ‘pathway’ along which the contamination may migrate and a ‘receptor’ at risk from the contamination.
- 6.3.2 Current legislation defines the various elements of the pollution linkage as:

- A contaminant is a substance that is in or under the ground and which has the potential to cause harm or to cause pollution of controlled waters
- A pathway is one or more routes through which a receptor is being exposed to, or affected by, a contaminant, or could be so affected
- A receptor is a living organism, an ecological system, a piece of land or property, or controlled water

6.3.3 A pollutant linkage indicates that all three elements have been identified. The site can only be defined as 'Contaminated Land' if a pollutant linkage exists and the contamination meets the criteria in Section 6.1 above.

6.4 Hazard Identification: On-site

- 6.4.1 The desk based research and historical review did not identify any significant potential hazards on the site from historic land use
- 6.4.2 The published radon risk to the site is ambiguous and should be referred to the local building control office for clarification

6.5 Hazard Identification: Off-site

- 6.5.1 The desk based research and historical review did not identify any potential hazards off-site that may impact upon the site

6.6 Hazard Assessment

- 6.6.1 The desk study has therefore not identified any specific pollutant linkages that require further consideration

7.0 ASSESSMENT OF POTENTIAL RISK

7.1 General

- 7.1.1 The assessment of potential risk has been based on the guidelines given in CIRIA report C552, ref 9.10. These guidelines are summarised in Appendix 3
- 7.1.2 The assessment of environmental risk is aimed at identifying the possible risk, if any, arising from substances used or deposited on the site, or from any other sources of land contamination. The assessment is based on the proposed future end use, taking account of present and previous use
- 7.1.3 The proposed end use will be hospital buildings
- 7.1.4 The assessment is based on the principles of the pollutant linkage. This assessment of the environmental risk is based only on a review of historical data and a walkover survey, therefore it contains some elements of

conjecture. A comprehensive risk assessment can only be made following an intrusive investigation and testing regime.

7.2 Sources of Contamination

- 7.2.1 The historical review and walkover survey have not identified any potential sources of contamination.

7.3 Pathways

- 7.3.1 In the absence of any potential sources of contamination no pathways are envisaged.

7.4 Assessment of Pollutant Linkage

- 7.4.1 In the absence of potential contaminant sources plausible pollutant linkages have not been formulated on the basis of current guidelines.

7.5 Conclusions of Risk Assessment

- 7.5.1 The study has not identified a potential source of contamination and as such a pollutant linkage has not been proven. Therefore, these findings suggest the site would not be classified by the Local Authority as 'Contaminated Land', under the current contaminated land legislation.

8.0 RECOMMENDATIONS FOR FURTHER WORK

- 8.1 As part of an investigation to determine geotechnical design parameters a prudent developer should consider carrying out a limited programme of sampling and analysis of soil and water samples to confirm the findings of the desk study.
- 8.2 In the absence of a specific contamination history analysis of samples may be limited to a general suite of commonly occurring contaminants.

Source map scale - 1:10,560

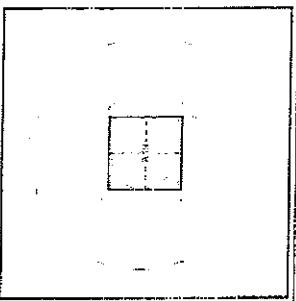

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1863 the 1:10,560 scale was adopted for mapping urban areas; these maps were used in update the 1:10,560 maps. The published date given here is often some years later than the surveyed date. Before 1928, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in surveying areas. In the late 1840's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overlaid with the National Grid. In 1870, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Ordnance Survey Plan

Published 1955

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the early 1950's. In 1954 the 1:2,500 scale was adopted for mapping urban areas, these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1956, all OS maps were based on the Cassini Projection. All independent surveys of a single county or group of counties, plus areas of significant interest in outlying areas, in the late 1950's & 1960's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially incorporated with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. This revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Ordnance Survey Plan Published 1964 - 1965

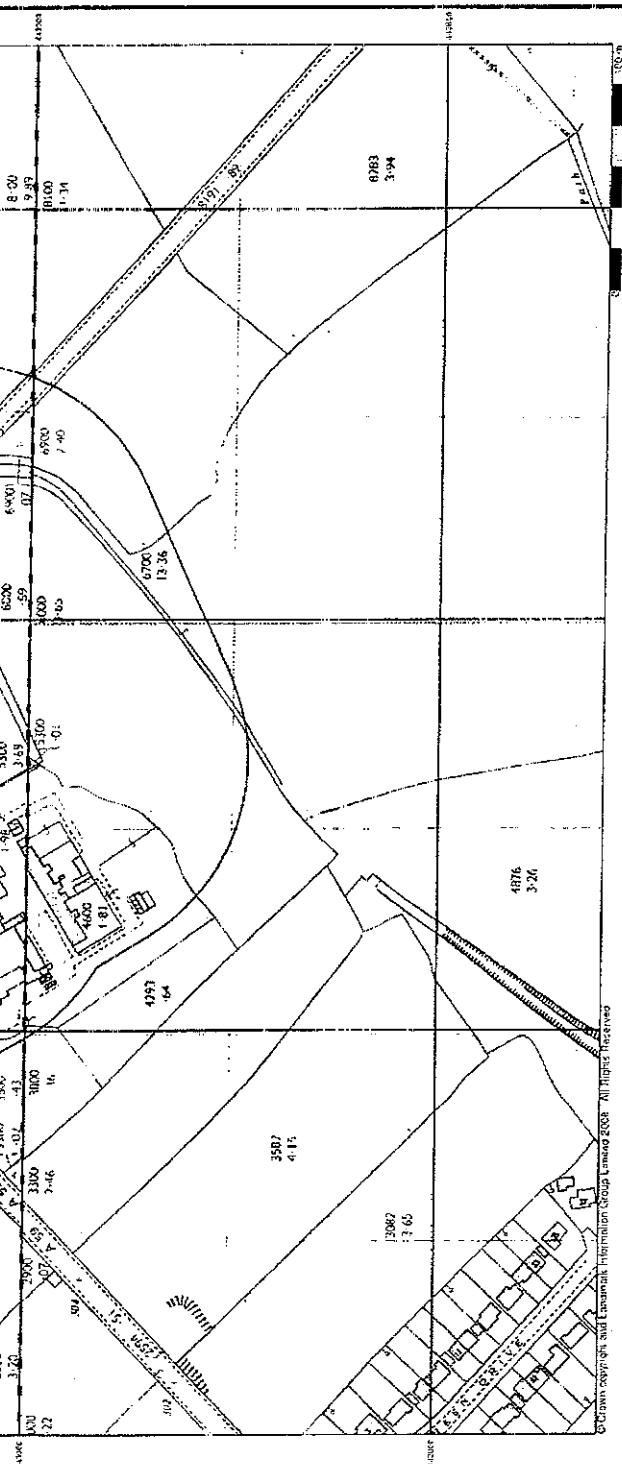

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1950's. In 1954 the 1:2,500 scale was adopted for mapping urban areas and by 1985 it covered the whole of what was considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the survey date. Before 1954 all OS maps were based on the Cassini Projection with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Ordnance Survey Plan Published 1970 - 1977

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the National Archives in London. In 1854 the scale adopted was 1:635,000. It covered Wales and Scotland. In 1855 the 1:250,000 scale was adopted for mapping urban areas and by 1856 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1918, all OS maps were based on the Ordnance Survey projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Additional SIMs

Published 1979 - 1989
Source map scale - 1:2,500

The SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data Published 1994

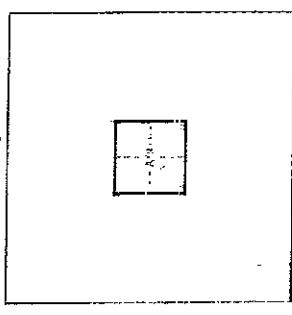

Source map scale - 1:2,500

Large Scale National Grid Data' Superseded 5IM cards (Ordnance Survey's Survey of Information on Microfilm) in 1992, and continued to be produced until 1998. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. Tegos maps were produced at both 1:2,500 and 1:1250 scales.

10K Raster Mapping

Published 2008

Source map scale - 1:10,000

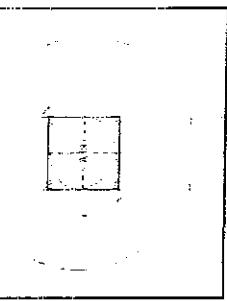

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from LandPlan, which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road unitary and classification. Boundary information, Boundary Description, District, Civil Parish and Constituency.

APPENDIX 3
ENVIRONMENTAL RISK

APPENDIX 3
POLLUTANT LINKAGE ASSESSMENT

A3.1 GENERAL

A3 1 1 The risk evaluation is a qualitative method for interpreting the data from the hazard estimation stage, ref 9 10 It involves the classification of the:

- magnitude of the potential 'consequence' (severity) of the risk occurring and:
- magnitude of the 'probability' (likelihood) of the risk occurring

A3 1 2 These may be defined as below

A3 2 CLASSIFICATION OF CONSEQUENCE

Classification	Definition	Examples
Severe	Short-term (acute) risk to human health likely to result in 'significant harm' as defined by the Environment Protection Act 1990, Part II A Short-term risk of pollution (note: Water Resources Act contains no scope for considering significance of pollution) of sensitive water resource Catastrophic damage to buildings property A short-term risk to a particular ecosystem, or organism forming part of such ecosystem (note: the definitions of ecological systems within the Draft Circular on Contaminated Land, DETR, 2000).	High Concentrations of cyanide on the surface of an informal recreation area Major spillage of contaminants from site into controlled water Explosion, causing building collapse can also equate to a short-term human health risk if buildings are occupied.
Medium	Chronic damage to Human Health ('significant harm' as defined in DETR, 2000) Pollution of sensitive water resources (note: Water Resources Act contains no scope for considering significance of pollution) A significant change in a particular ecosystem, or organism forming part of such ecosystem, (note: the definitions of ecological systems within Draft Circular on Contaminated Land, DETR, 2000).	Concentrations of a contaminant from site exceed the generic, or site-specific assessment criteria Leaching of contaminants from a site to a major or minor aquifer Death of a species within a designated nature reserve.
Mild	Pollution of non-sensitive water resources Significant damage to crops, buildings, structures and services ('significant harm' as defined in the <i>Draft Circular on Contaminated Land</i> , DETR 2000) Damage to sensitive buildings/structures/services or the environment.	Pollution of non-classified ground water Damage to building rendering it unsafe to occupy (eg foundation damage resulting in instability).
Minor	Harm, although not necessarily significant harm, which may result in a financial loss, or expenditure to resolve Non-permanent health effects to human health (easily prevented by means such as personal protective clothing etc) Easily repairable effects of damage to buildings, structures and services	The presence of contaminants at such concentrations that protective equipment is required during site works The loss of plants in landscaping scheme. Discoloration of concrete

A3 2 1 In theory, both severe and medium classification can result in death. The differential is that severe relates to short term risk while medium relates to long-term risk. Therefore, the classification of severe requires urgent action while medium may require urgent action but usually long term action would be sufficient

A3.3 Classification of Probability

Classification	Definition
High likelihood	There is a pollution linkage and an event that either appears very likely in the short term and almost inevitable over the long term, or there is evidence at the receptor of harm or pollution
Likely	There is a pollution linkage and all the elements are present and in the right place, which means that it is probable that an event will occur Circumstances are such that an event is not inevitable, but possible in the short term and likely over the long term.
Low likelihood	There is a pollution linkage and circumstances are possible under which an event could occur However, it is by no means certain that even over a longer period such event would take place, and is less likely in the shorter term
Unlikely	There is a pollution linkage but circumstances are such that it is improbable that an event would occur even in the very long term

A3 4 Comparison of Consequence Against Probability

A3 4 1 These classifications are compared to indicate the risk presented by each pollutant linkage. Once the consequence and probability have been classified they can be used to produce a risk category as below:

Probability	Consequence				
	Severe	Medium	Mild	Minor	
Likelihood	High likelihood	Very high risk	High risk	Moderate risk	Moderate/low risk
	Likely	High risk	Moderate risk	Moderate/low risk	Low risk
	Low likelihood	Moderate risk	Moderate/low risk	Low risk	Very low risk
	Unlikely	Moderate/low risk	Low risk	Very low risk	Very low risk

A3 4 2 The action required for the classified risks are as follows:

Very high risk	There is a high probability that severe harm could a risk to a designated receptor from an identified hazard, OR, there is evidence that severe harm to a designated receptor is currently happening This risk, if realised, is likely to result in a substantial liability Urgent investigation (if not undertaken already) and remediation are likely to be required
High risk	Harm is likely to arise to a designated receptor from an identified hazard Realisation of the risk is likely to present a substantial liability Urgent investigation (if not undertaken already) is required and remedial works may be necessary in the short term and are likely over the longer term

Moderate risk	<p>It is possible that harm could arise to a designated receptor from an identified hazard. However, it is either relatively unlikely that any such harm would be severe, or if any harm were to occur it is more likely that the harm would be relatively mild.</p> <p>Investigation (if not already undertaken) is normally required to clarify the risk and to determine the potential liability. Some remedial works may be required in the longer term.</p>
Low risk	It is possible that harm could arise to a designated receptor from an identified hazard, but it is likely that this harm, if realised, would at worst normally be mild.
Very low risk	There is a low possibility that harm could arise to a receptor. In the event of such harm being realised it is not likely to be severe.

Introduction

The Environment Act 1995 has made site sensitivity a key issue as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.

For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency and the Scottish Environment Protection Agency; It also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.

In the attached datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers

	Groundwater Vulnerability Geological Classification: Minor Aquifer (Varily permeable) - These can be fractured or potentially fractured rocks which do not have a high primary permeability, or other formations of variable permeability including unconsolidated deposits. Although not producing large quantities of water for abstraction they are important for local supplies and in supplying base flow to rivers Soil Classification: Soils of Low Leaching Potential - Soils in which pollutants are unlikely to penetrate the soil layer because water movement is largely horizontal or they have large ability to attenuate diffuse pollutants. Lateral flow from these soils contribute to groundwater recharge elsewhere in the catchment Map Sheet: Sheet 10 Central Lancashire Scale: 1:100,000	A18SW (N)	0	1	376497 443405
	Drift Deposits Drift Deposit: Low permeability drift deposits occurring at the surface and overlying Major and Minor Aquifers are head, clay-with-flints, brickearth, peat, river terrace deposits and marine and estuarine alluvium Map Sheet: Sheet 10 Central Lancashire Scale: 1:100,000	A13SW (S)	0	1	375488 442782

Report Section and Details	Page Number
Summary	-
The Summary section provides an overview of the data contained within the report detailing the number of data set features or the existence of a data set in relation to the buffer selected	
For ease of reference, the report is broken down into 4 sections of data; Mining and Natural Cavities Data, Historical Land Use Information (1:2 500) Historical Land Use Information (1:10 000) and Ground Stability Data (1:50 000)	
Mining and Natural Cavities Data	1
The Mining and Natural Cavities Data section features data sets related to the existence of mining areas and their potential hazards	
Data sets within this section are not plotted, with the exception of BGS Recorded Mineral Sites and Potential Mining Areas which feature on the Historical Land Use Information (1:10 000) map	
Historical Land Use Information (1:2,500)	2
The Historical Land Use Information (1:2 500) section contains data captured from analysis carried out by Landmark of 1:1,250 and 1:2,500 scale historical Ordnance Survey mapping identifying areas where historically the land uses were potentially contaminative	
For the purpose of this Envirocheck module, only historical data relating to mining and ground stability has been included and plotted on the corresponding Historical Land Use Information (1:2 500) map. This section also includes the Subterranean Features data set, which details various man-made and man-used underground spaces obtained from the Subterranea Britannica society	
Historical Land Use Information (1:10,000)	3
The Historical Land Use (1:10,000) section covers data captured from the systematic analysis carried out by Landmark of 1:10, 560 and 1:10 000 scale historical Ordnance Survey mapping dating back to the mid-19th century identifying potentially contaminative past industrial land uses	
For the purpose of this Envirocheck module, only data relating to mining and ground stability has been included and plotted on the accompanying Historical Land Use Information (1:10 000) map	
Ground Stability Data (1:50,000)	5
The Ground Stability (1:50 000) section consists of the 6 BGS Geosure data sets each reporting potential hazards up to 250m and plotted onto the 3 separate maps	
Also included in this section are the brine and salt mining data sets of which Brine Pumping Related Features and Salt Mining Related Features are plotted	
Historical Map List	6
The Historical Map List section details the historical mapping that has been analysed for your site in relation to the Historical Land Use Information sections	
Data Currency	7

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice

Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are determined by factors of the alphabet, starting from the bottom left corner of the slice "Grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment

A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant

A quadrant is a quarter of a segment. Those are labelled as NW, NE, SW, SE plots. As referenced in the database to allow features to be quickly located on Slice A, Segment 7 and the NW Quadrant.

A selection of organisations who provide data within this report:

Envirocheck reports are compiled from 136 different sources of data.
