Dear Mr Holgate

Re: EPS – Daylight scoping survey: Deep Meadows, Osbaldeston Lane, Blackburn, BB7 7LT

You have requested a European Protected Species scoping survey on behalf of your client Kevin Tebbutt, as a condition of a planning application to Ribble Valley Borough Council (RVBC) for building alterations at the above property in Osbaldeston.

The Local Planning Authority is required to take account of the impact of a development on protected species in accordance with current planning policy (National Planning Policy Framework). RVBC requires an appraisal of the likely impact of the proposed development on all bat species that are present or likely to be present at the site, in addition to any mitigation and enhancement works that may be necessary.

As a consequence of the historical declines in bat populations during the second half of the twentieth century, all bats and their roosts are protected by UK law. The depletion of natural habitats throughout the UK means that some bat species are now more than ever dependent on houses and other structures as roosting sites. It is this dependence that makes them vulnerable to redevelopments that can result in damage or destruction of a roost, particularly maternity roosts, resulting in negative impacts on a local bat population.

Since 2008 bats have been included in the list of UK Biodiversity indicators which aim to show the response of species to the pressures, changes and threats to our natural and built environment.

A preliminary roost assessment (scoping survey) has found no evidence of roosting activity by bats or wild birds in any part of the building that is likely to be affected by the proposed building operations.

The conservation significance of the building is currently low therefore the scale of impact of the development on the favourable conservation status of local bat species is also likely to be minimal / low.

It is recommended the development proceeds without a requirement to obtain a development licence (EPSL) since the proposed building works are unlikely to result in a breach of the Habitats Regulations.

Please find a copy of the survey report now attached.

Yours sincerely

David Fisher
Director (EED Surveys)

(European Protected Species)

PRELIMINARY ROOST ASSESSMENT – BAT SURVEY REPORT

Deep Meadows, Osbaldeston Lane, BB7 7LT

Introduction

This type of survey can be undertaken during daylight hours at any time of year and is not dependent on whether bats or wild birds are active at the time of the inspection.

A preliminary roost assessment (also referred to as a presence or absence survey) requires an inspection of the external and internal features of a building to look for evidence of flight, feeding, perching or other indicative signs of bat activity.

The aim of the survey is to determine the actual or potential presence of bats and whether further survey effort is likely to be required. The wider aim of the survey is to assess the potential value of the site for European Protected Species (EPS) to establish whether bats, barn owls and other nesting wild birds have been active within any part of the building that is likely to be affected by the proposed development.

From the developer's perspective, the primary objective of a survey for protected species is to ensure that a development can proceed lawfully without breaching the Habitats Regulations

Timing of survey / weather conditions

The scoping survey was undertaken on Tuesday 26 April 2016 between 10.00 and 10.30.

The weather at the time of the inspection was cool, dry and bright (min. temperature: 5°C, cloud: 60%, wind: light northerly breeze, rain: nil) providing optimal conditions for this level of survey.

Personnel

The inspection was carried out by David Fisher (EED Surveys) - an ecological consultant with more than 25 years of experience in field survey work and development issues relating to protected species. The surveyor has held a licence since 1989 and is a volunteer bat worker with Natural England (via the BCT), a participating member of several UK bat groups and founder member of the Bowland Kilns and Caves Research Group.

Natural England Class Licence WML-A34 - Level 1 (Registration Number: 2015 – 17599-CLS-CLS)

Natural England Class Licence WML-A34 – Level 2 (Registration Number: 2015 – 12106-CLS-CLS)

Aims of the survey

The aims* of the survey are generally to:

- Collect robust data following good practice guidelines
- Facilitate the design of mitigation, enhancement and monitoring strategies for bats where appropriate
- Provide baseline information with which the results of post-development monitoring can be compared
- Provide clear information to enable the LPA and licensing authority to reach a robust decision
- Assist clients in meeting their statutory obligations
- Facilitate the conservation of bat populations

Objectives of the survey

The broad objectives* of the survey are to:

- observe, assess and record suitable roosting, feeding, foraging and commuting habitat for bats (and other protected species) both on site and in the surrounding area.
- determine the actual or potential presence of bats (and other protected species) and the need for further survey and / or mitigation.

* Defining aims and objectives, p15 BCT Bat Surveys - Good Practice Guidelines, (3rd edition 2016)

Survey methodology

The survey methodology is designed to determine the likely presence of bats within the property and does not necessarily prove absence.

Non-invasive survey methods were used to assess the use of the property by protected species.

The survey protocol requires a full visual inspection of all internal and external features of the building including any safely accessible roof voids and out-buildings that are likely to be affected by the proposed works.

The survey methodology follows the recommended guidelines published by the Bat Conservation Trust - *Bat Surveys: Good Practice Guidelines, 2nd Edition, Hundt, L (2012)*, Natural England (*Survey Objectives, Methods and Standards as outlined in the Bat Mitigation Guidelines, 2004*) and Chapter 3 - Survey and Monitoring Methods, (*Bat Worker's Manual, JNCC, Mitchell-Jones AJ and McLeish, AP, 3rd Edition 2004*).

The search was made using a high-powered lamp (*Clu-lite CB2 - 1,000,000 candle power*), close-focussing binoculars (*Leica Trinovid 10 x 32 BN*) and digital camera (*Sony Cyber-shot HX300*) were used to view all likely areas of the building for the presence of bats - ie. droppings and urine spots, bat corpses, bat fly larvae, roost staining or evidence of feeding remains such as discarded moth and butterfly wings or other insect fragments typically found in a perching and feeding area.

Survey limitations

In most situations it is not possible to inspect all locations where bats may be present and therefore an absence of bat evidence does not equate to evidence of bat absence.

Crevice-roosting bat species are able to roost within very narrow gaps, frequently less than 25mm wide; solitary roosting bats are sometimes overlooked during daylight inspections, particularly in situations where bats have gained access within rubble infill walls and beneath roof materials and other significant structural features.

Evidence of bat activity such as bat droppings or staining on external walls and surfaces is frequently removed by the action of wind and rain; apparent absence of evidence is therefore evaluated with caution.

National Biodiversity Network (NBN) and other data sources, whilst indicative of the bat species likely to occur within a 10km-grid square, do not confirm presence or absence of a species or habitat.

Local bat records are compiled from a number of reliable sources but may also include unverified public data.

Proposed works

The proposed development is a single storey front extension to the bungalow requiring modifications to the existing roof and roof void.

Pre-survey data search

The aim of the pre-survey data search (also called a desk study or scoping study) is to collate background information around the proposed development site on bat activity, roosts and significant landscape features that may be used by bats. The key sources of information used in this report include:

- (1) European Protected Species (EPS) - ie. species records of local, regional or national significance.
- (2) National Biodiversity Network (NBN) terrestrial mammal records (chiroptera).
- (3) Local bat records: (i) East Lancashire Bat Group (ELBG) (ii) EED Surveys (iii) other ecological consultants.
- (4) Interactive maps: *Natureonthemap* (Natural England) and *Magic.gov.uk*.

The following bat species are likely to be present within the 10km national grid squares: SD 63 / SD73

Common name	Scientific name	Status of local population
Natterer's bat	<i>(Myotis nattereri)*^{1 2}</i>	widespread / common
Whiskered bat	<i>(M. mystacinus)¹</i>	widespread / uncommon
Brandt's bat	<i>(M. brandtii)</i>	infrequent / uncommon
Daubenton's bat common	<i>(M. daubentonii)*^{1 2}</i>	widespread / locally
Brown long-eared bat common	<i>(Plecotus auritus)*^{1 2}</i>	widespread / locally
Common pipistrelle	<i>(Pipistrellus pipistrellus)*^{1 2}</i>	widespread / common
Soprano pipistrelle common	<i>(P. pygmaeus)^{1 2}</i>	widespread / locally
Nathusius's pipistrelle	<i>(P. nathusii)²</i>	current distribution unknown
Noctule bat common	<i>(Nyctalus noctula)^{1 2}</i>	widespread / locally

*NBN data ¹East Lancashire Bat Group ²EED surveys

Pre-existing information

The owner of the property is not aware of any bats inside the property.

An on-line data search has found no reference to previous EPS scoping surveys / bat surveys at this location.

A data search has found no records of roosting bats at this location.

Bats in the Ribble Valley

At least eight species of bats are recorded in the Ribble Valley and Forest of Bowland AONB within a very wide range of habitats, particularly where there is open standing water, river channels and riparian woodland habitat.

Although some species are largely dependent on trees and woodland, all species are known to rely on buildings for at least part of their life cycle; these include all types of residential properties, barns and agricultural units.

A number of bat species within the district frequently use natural features such as underground sites, quarries and natural limestone scars for roosting, mating and winter hibernation. Local research over the last decade has shown that low numbers of bats regularly roost and hibernate in old lead mines, railway tunnels, lime kilns and bridges throughout the district.

Contrary to popular belief, houses built after 1970 are most frequently used as maternity and nursery sites by breeding bats during the warmest summer months (May to August) when pregnant female bats gather in the warmest sites to give birth to their young. During late summer and autumn adults and young bats leave their breeding roosts and disperse throughout the district. From October / November until March / April the following year most bats are relatively inactive during their winter hibernation period.

Page 3 of 6

Location of the property NGR: SD 646 320 Elevation: 100 metres

The property is located in a semi-rural area of the Ribble Valley at Osbaldeston Lane and is close to open countryside to the north of the site with extensive farmland and grazing nearby. Although the locality has a number of well-established hedgerows with standards mainly along field boundaries and roadsides, there are no extensive broadleaved woodlands or conifer plantations within 500 metres of the property.

The location of the property is sub-optimal in terms of access to high-value feeding, foraging and commuting habitat for bats. The nearest riparian woodland is situated approximately 0.75km west at Mammon Wood and Mellor Brook is the nearest water channel of any significance within the locality.

A local data search has shown there are no designated nature conservation sites adjacent to this property ie. Special areas of Conservation (SACs), Sites of Special Scientific Interest (SSSI), Biological Heritage Sites (BHS), National Nature Reserves (NNR's), Local Nature Reserves (LNR's) or Regionally Important Geological and Geo-morphological Sites (RIGS).

Description of the property

The property is a modern-style bungalow (built circa late 1960's) with integral garage, rendered brick and block cavity wall construction and duo-pitched rafter-with-purlin roof. The property is double-glazed throughout and all areas are well-maintained and secure (figures 1 to 6 below).

The property has a composite slate roof lined with hessian and bitumen felt; the roof void appears to be very well-sealed and is insulated with a 300mm deep glass fibre material over the ceiling joists in addition to some loose-fill insulation between the ceiling joists.

There is no evidence of access by roosting bats or wild birds.

A warfarin-type rodenticide has been applied in bait trays inside the main void to deal with small rodents (mice).

Externally, all roof materials, verges, ridge tiles, fascias and box soffits are secure and there are no signs of access bats.

House martins have previously nested below the apex of the west gable end wall.

Figure 3: roof void

Figure 4:

Figure 5:

Survey results (BATS)

There are signs of access by roosting bats or nesting wild birds at the property.

There are no signs of droppings on the external walls and all parts of the building are well-sealed and secure.

Evaluation of results

The building is very low risk in terms of conservation significance; all roof areas are secure and therefore the buildings has minimal potential as a bat roost.

It is unlikely that roosting or resting bats will be disturbed during the proposed development.

Impact assessment

The scale of impact of the proposed development on roosting bats is minimal*

Minimal: it is highly unlikely any bat species have been active within any part of the property.

***Low risk:** there is only low risk of disturbance to solitary bats or small numbers of common and widespread bat species.

Low / moderate risk: caution required; activity of common / rarer species is possible, including the presence of occasional / regular night perching and feeding activity or the presence of small numbers of rarer species (but not a maternity or hibernation site).

Moderate risk: caution required; there is moderate risk of disturbance to common bat species; activity may include the presence of regular / significant feeding perches and signs of feeding, a regularly used day / night roost or a maternity site of a common and widespread species or the likely presence of low numbers of rarer species ('rarer' as defined within the local context).

Moderate / high risk: considerable caution is required; this category may include a maternity site of rarer species.

High risk: considerable / extreme caution is required; there is a significant risk of causing disturbance to roosting bats at this site including large numbers of common species, a maternity site of locally rare or rarest UK species or a significant hibernation site for rare or rarest species; this is likely to be a site meeting the SSSI guidelines.

Table 1: *Based on Guidelines for proportionate mitigation - Bat Mitigation Guidelines (2004) fig. 4, page 39

Summary and recommendations

The conservation significance of this property is low.

The proposed extension and roof works are **unlikely to cause disturbance to bats** or result in the loss of a bat roost or cause injury or death of a European Protected Species – (Bats) or result in any significant impact on a local bat population.

The **scale of impact** of building works at site level on local bat populations is likely to be **minimal**.

It is recommended the works proceed without a requirement to obtain a development licence (EPSL) since the proposed development is unlikely to result in a breach of the Habitats Regulations.

Further survey effort at this property is not required.

ANNEX 1

Wildlife legislation - Bats and the law

All bat species in the UK receive full protection under the Wildlife and Countryside Act 1981 (amended by the Environment Protection Act 1990). The Countryside and Rights of Way Act 2000 amends the Wildlife and Countryside Act to also make it an offence to intentionally or recklessly damage, destroy or obstruct a place that bats use for shelter or protection. All species of bats are listed on Schedule 5 of the 1981 Act, which makes it an offence to:

- *intentionally kill, injure or take any wild bat.*
- *intentionally or recklessly damage, destroy or obstruct access to any place that a wild bat uses for shelter or protection. This is taken to mean all bat roosts whether bats are present or not.*
- *intentionally or recklessly disturb any wild bat while it is occupying a structure or place which it uses for shelter or protection.*

The protected status afforded to bats means planning authorities may require extra information (in the form of surveys, impact assessments and mitigation proposals) before determining planning applications for sites used by bats. Planning authorities may refuse planning permission solely on grounds of the predicted impact on protected species such as bats. Recent case law has underlined the importance of obtaining survey information prior to the determination of planning consent¹.

*"It is essential that the presence or otherwise of protected species, and the extent that they may be affected by a development proposal, is established before the planning permission is granted, otherwise all relevant material considerations may not have been addressed in making the decision."*²

All British bat species are included in Schedule 2 of the Conservation (Natural Habitats, &c.) (Amendment) Regulations 2007, (also known as Habitats Regulations) which defines 'European Protected Species' (EPS).

¹ Bat Mitigation Guidelines, AJ Mitchell Jones, Joint Nature Conservation Committee, (2004) ISBN 1 86107 558 8

² Planning Policy Statement (PPS9) (2005), Biodiversity and Geological Conservation. ODPM.

Protected species (Bats) and the planning process

Our built environment has the potential to have major negative impacts on biodiversity. However, if done sensitively, the development and refurbishment of buildings can, in fact, increase the ecological value of the site.*

For development proposals requiring planning permission, the presence of bats, and therefore the need for a bat survey, is an important 'material planning consideration'. Adequate surveys are therefore required to establish the presence or absence of bats, to enable a prediction of the likely impact of the proposed development on them and their breeding sites or resting places and, if necessary, to design mitigation and compensation. Similarly, adequate survey information must accompany an application for a Habitats Regulations licence (also known as a Mitigation Licence) required to ensure that a proposed development is able to proceed lawfully¹.

The term 'development' [used in these guidelines] includes all activities requiring consent under relevant planning legislation and / or demolition operations requiring building control approval under the Building Act 1984.

Natural England (Formerly English Nature) states that development in relation to bats "covers a wide range of operations that have the potential to impact negatively on bats and bat populations. Typical examples would be the

construction, modification, restoration or conversion of buildings and structures, as well as infrastructure, landfill or mineral extraction projects and demolition operations".²
