Summary

In August 2018 Batworker consultancy was commissioned to undertake a survey of 86 Mitton Road, Whalley, BB7 9JN to assess the potential for use by bats.

A daytime survey was carried out on 7th August 2018 in order to support plans to extend the property as part of redevelopment plans.

No birds were observed using the building for nesting.

No evidence was recorded to suggest bats were roosting within the building.

No bats were observed or recorded using the building for roosting.

The building is considered to be of negligible potential for roosting bats.

The surveyor considers survey effort to be reasonable to assess the roost potential of the building and no further survey work is deemed appropriate.

The surveyor does not consider the proposed development and change of use is likely to result in a breach of the Conservation (Natural Habitats &c.) Regulations 1994 (as amended) therefore the proposed development does not require an EPS Licence (EPSL) to proceed lawfully.

Introduction

In August 2018 Batworker consultancy was commissioned to undertake a survey of 86 Mitton Road, Whalley, BB7 9JN to assess the potential for use by bats.

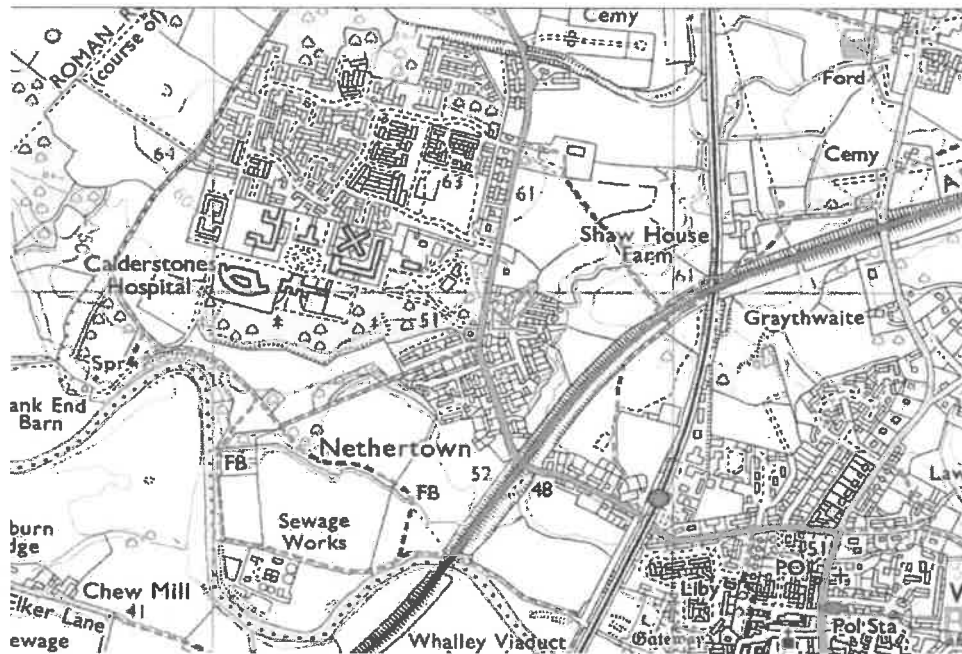

A daytime survey was carried out on 7th August 2018 in order to support plans to extend the property as part of redevelopment plans.

Survey and Site Assessment

Objectives of the survey

The survey was carried out to determine current usage by bats, and other protected species, of the site and to establish status of the bat species using the site prior to development work being carried out.

Survey site location

A central grid reference for the site is SD7260236911

Site/Habitat description

The property consists of a brick built semi detached two storey house with multi pitch slate roof. The first floor front wall and rear ground floor is rendered. A single storey single pitch roofed extension is present to the rear. Roofs feature well sealed ridge tiles and close fitting slates. Lead flashing is in good condition and close fitting.

The main house loft space is insulated and a slates are unlined and sealed with plaster. Soffits are tight fitting with no obvious gaps or crevices.

Overall the building offers negligible roosting opportunities.

Surrounding habitat.

The property is located in a semi-rural setting on the edge of Whalley with surrounding habitat dominated by improved and semi improved grassland. To the west woodland associated with Calderstones Park offers considerable foraging opportunities.

Overall foraging potential for bats can be considered moderate to high.

Pre Existing data on local bat species

A search of the MAGIC website revealed no EPS licence applications within a 1km radius. The East Lancashire Bat Group database holds one common pipistrelle roost record within 1km associated with Calderstones .

From personal experience of surveying for and researching bats in Lancashire, Yorkshire and Cumbria, and Calderdale in particular, the following species were considered.

Common Pipistrelle – known to roost on sites where suitable foraging habitat is available.

Soprano Pipistrelle – known to roost on sites where suitable foraging habitat is available.

Whiskered/Brandt's – species often found roosting in buildings close to woodland.

Natterer's – a typical upland bat with foraging bats being recorded high on heather moorland. Often roosting in barns.

Daubenton's – a species commonly associated with aquatic habitats.

Long Eared bat – a woodland species which has been recorded foraging over in bye meadows and rough grassland sites. Often roosting in barns.

Field Survey Methodology

Visual inspection

An inspection was carried out to search for and identify potential feeding perches, roosting opportunities and signs of bat use both internally and externally.

The visual inspection focussed on searching for feeding remains and bat droppings both within the building and on external walls. Crevices and other potential roost sites were investigated for smear/grease marks, lack of cobwebs, urine staining.

Equipment used included:

- ! Lupine Pico LED torch
- ! SeeSnake CA 300 video endoscope
- ! Opticron close focusing binoculars

Personnel

All surveys were conducted by Dave Anderson MSc, Natural England Science, Education and Conservation bat licence holder (2015-15784-CLS-CLS) a bat surveyor and ecologist with 20 years experience.

Survey Summary

Survey	Date	Timings
Visual	07.08.2018	1 Hour

Survey constraints

Access to all areas of the interior and exterior of the building was possible and good visual inspection at ground level was possible.

Results

Visual Inspection - Bats

No recent droppings or feeding remains were recorded. No staining, urine splashing or droppings were recorded. No suitable crevices or potential roost features were recorded.

Visual Inspection – Nesting birds

No nesting birds were observed during the survey.

Evaluation of the results

No recent signs of bats were recorded within the building or on exterior walls, a search for scattered droppings typical of bats returning to roost found no evidence, despite a period of good weather in the preceding two weeks. The building was assessed as offering little in the way of roosting potential.

With no real opportunities for bats to use the building the surveyor considers there is no need for further surveys and no constraints on proposed development work.

Suitability	Description Roosting habitats	Commuting and foraging habitats
Negligible	Negligible habitat features on site likely to be used by roosting bats.	Negligible habitat features on site likely to be used by commuting or foraging bats.
Low	A structure with one or more potential roost sites that could be used by individual bats opportunistically. However, these potential roost sites do not provide enough space, shelter, protection, appropriate conditions and/or suitable surrounding habitat to be used on a regular basis or by larger numbers of bats (i.e. unlikely to be suitable for maternity or hibernation). A tree of sufficient size and age to contain PFRs but with none seen from the ground or features seen with only very limited roosting potential.	Habitat that could be used by small numbers of commuting bats such as a gappy hedge-row or unvegetated stream, but isolated, i.e. not very well connected to the surrounding landscape by other habitat. Suitable, but isolated habitat that could be used by small numbers of foraging bats such as a lone tree (not in a parkland situation) or a patch of scrub.
Moderate	A structure or tree with one or more potential roost sites that could be used by bats due to their size, shelter, protection, conditions and surrounding habitat but unlikely to support a roost of high conservation status (with respect to roost type only – the assessments in this table are made irrespective of species conservation status, which is established after presence is confirmed).	Continuous habitat connected to the wider landscape that could be used by bats for commuting such as lines of trees and scrub or linked back gardens. Habitat that is connected to the wider landscape that could be used by bats for foraging such as trees, scrub, grassland or water.
High	A structure or tree with one or more potential roost sites that are obviously suitable for use by larger numbers of bats on a more regular basis and potentially for longer periods of time due to their size, shelter, protection, conditions and surrounding habitat.	Continuous, high-quality habitat that is well connected to the wider landscape that is likely to be used regularly by commuting bats such as river valleys, streams, hedgerows, lines of trees and woodland edge. High-quality habitat that is well connected to the wider landscape that is likely to be used regularly by foraging bats such as broadleaved woodland, tree-lined watercourses and grated parkland. Site is close to and connected to known roosts.

From Bat Survey Guidelines 3rd Edition

Conclusion

No birds were observed using the building for nesting.

No evidence was recorded to suggest bats were roosting within the building.

No bats were observed or recorded using the building for roosting.

The building is considered to be of negligible potential for roosting bats.

The surveyor considers survey effort to be reasonable to assess the roost potential of the building and no further survey work is deemed appropriate.

The surveyor does not consider the proposed development and change of use is likely to result in a breach of the Conservation (Natural Habitats &c.) Regulations 1994 (as amended) therefore the proposed development does not require an EPS Licence (EPSL) to proceed lawfully.

Bats and the Law

Wildlife and Countryside Act 1981, principally those relating to powers and penalties, have been amended by the Countryside and Rights of Way Act 2000 (CRoW Act). The CRoW Act only applies to England and Wales.

Section 9(1)

It is an offence for any person to intentionally kill, injure or take any wild bat.

Section 9(4)(a)

It is an offence to intentionally or recklessly* damage, destroy or obstruct access to any place that a wild bat uses for shelter or protection.

(*Added by the CRoW Act in England and Wales only)

This is taken to mean all bat roosts whether bats are present or not.

Section 9(4)(b)

It is an offence to intentionally or recklessly* disturb any wild bat while it is occupying a structure or place that it uses for shelter or protection.

(*Added by the CRoW Act in England and Wales only)

The Conservation (Natural Habitats, &c.) Regulations 1994

Section 39(1)

It is an offence

(a) deliberately to capture or kill any bat

(b) deliberately to disturb any bat

(d) to damage or destroy a breeding site or resting place of any bat.

The difference between this legislation and the Wildlife and Countryside Act 1981 is the use of the word 'deliberately' rather than 'intentionally'. Also disturbance of bats can be anywhere, not just at a roost. Damage or destruction of a bat roost does not require the offence to be intentional or deliberate.

Barn Owls and the Law

Part 1 of the Wildlife and Countryside Act (1981)

(1) Subject to the provisions of this Part, if any person intentionally (or recklessly as amended by the CRoW Act, 2000) (a) kills, injures or takes any wild bird; (b) takes, damages or destroys the nest of any wild bird while

that nest is in use or being built; or (c) takes or destroys an egg of any wild bird. he shall be guilty of an offence.

(5) Subject to the provisions of this Part, if any person intentionally- (a) disturbs any wild bird included in Schedule 1 while it is building a nest or is at, on or near a nest containing eggs or young; or (b) disturbs dependent young of such a bird, he shall be guilty of an offence and liable to a special penalty.

Countryside and Rights of Way (CRoW) Act (2000)

Part III Nature conservation and wildlife protection

74 Conservation of biological diversity

(1) It is the duty of (a) any Minister of the Crown (within the meaning of the Ministers of the [1975 c. 26.] Crown Act 1975), (b) any Government department, and (c) the National Assembly for Wales, in carrying out his or its functions, to have regard, so far as is consistent with the proper exercise of those functions, to the purpose of conserving biological diversity in accordance with the Convention.

SCHEDULE 12 AMENDMENTS RELATING TO PART I OF WILDLIFE AND COUNTRYSIDE ACT 1981

1. In section 1(5) of the 1981 Act (offence of intentional disturbance of wild birds) after "intentionally" there is inserted "or recklessly".

The Natural Environment and Rural Communities Act (2006)

PART 3, (40): Duty to conserve biodiversity

(1) Every public authority must, in exercising its functions, have regard, so far as is consistent with the proper exercise of those functions, to the purpose of conserving biodiversity.

(3) Conserving biodiversity includes, in relation to a living organism or type of habitat, restoring or enhancing a population or habitat.
