Mr Ray Fish

6 Knighton Avenue Blackburn BB2 7BU

6 November 2017 1889

Job ref: B

Dear Mr Fish

Re: EPS - Daylight scoping survey: 'Camberley' No. 2A Branch Rd. Mellor Brook, Blackburn. BB2 7NU

You have requested a scoping survey (European Protected Species) on behalf of your client Mr Ahmed, as a condition of a planning application to Ribble Valley Borough Council (RVBC) for building alterations at the above property.

The Local Planning Authority is required to take account of the impact of a development on protected species in compliance with current planning policy (National Planning Policy Framework). RVBC requires an appraisal of the likely impact of the proposed development on all bat species that are present or likely to be present at the property, in addition to any mitigation and enhancement works that may be necessary.

As a consequence of the historical declines in bat populations during the second half of the twentieth century, all bats and their roosts are protected by UK law. The depletion of natural habitats throughout the UK means that some bat species are now more than ever dependent on houses and other structures as roosting sites. It is this dependence that makes them vulnerable to redevelopments that can result in damage or destruction of a roost, particularly maternity roosts, resulting in negative impacts on a local bat population.

Since 2008 bats have been included in the list of UK Biodiversity Indicators which aim to show the response of species to the pressures, changes and threats to our natural and built environment.

A preliminary roost assessment (scoping survey) has found no evidence of bat roosting activity at this property.

There are no signs of any maternity roost, mating roost or place of hibernation and it is unlikely that bats have ever been present at this site. The proposed building alterations are unlikely to result in disturbance to roosting bats; therefore the overall impact of the development on protected species is likely to be minimal in this case.

It is recommended the development proceeds without a requirement to obtain a development licence (EPSL) since the proposed building works are unlikely to result in a breach of the Habitats Regulations.

Please find a copy of the survey report now attached.

Yours sincerely

Sami € Fider

David Fisher

Director (EED Surveys)

(European Protected Species)

PRELIMINARY ROOST ASSESSMENT - EPS SCOPING REPORT

Camberley, 2A Branch Road, Mellor Brook, Blackburn, BB2 7NU

Date of survey: 6 November 2017

Introduction

The Local Planning Authority is required to take account of the impact of a development on protected species in compliance with current planning policy (National Planning Policy Framework). RVBC requires an appraisal of the likely impact of the proposed development on all bat species that are present or likely to be present at the property, in addition to any mitigation and enhancement works that may be necessary.

As a consequence of the historical declines in bat populations during the second half of the twentieth century, all bats and their roosts are protected by UK law. The depletion of natural habitats throughout the UK means that some bat species are now more than ever dependent on houses and other structures as roosting sites. It is this dependence that makes them vulnerable to redevelopments that can result in damage or destruction of a roost, particularly maternity roosts, resulting in negative impacts on a local bat population.

Since 2008 bats have been included in the list of UK Biodiversity Indicators which aim to show the response of species to the pressures, changes and threats to our natural and built environment.

Timing of survey / weather conditions

The scoping survey was undertaken on Monday 6 November 2017 between 14.00 and 15.00.

The weather at the time of the inspection was mild, dry and bright (min. temperature: 9°C, cloud: 40%, wind: light F1 south-westerly, rain: nil) providing satisfactory conditions for this level of survey.

Personnel

The inspection was carried out by David Fisher (EED Surveys) - an ecological consultant and Natural England volunteer bat roost visitor and bat licence holder since 1989.

Current licences held:

Natural England Class Licence WML-A34 - Level 1 (Registration Number: 2015 - 17599-CLS-CLS)

Natural England Class Licence WML-A34 - Level 2 (Registration Number: 2015 - 12106-CLS-CLS)

Aims of the survey*

Collect robust data to determine the likely impacts of the proposed development on bat populations and other protected species at the property.

Facilitate the design of mitigation, enhancement and monitoring strategies for bats and all protected species.

Provide a clear assessment of risk to bats and other protected species enabling the Local Planning Authority to reach an informed planning decision.

Assist clients in meeting their statutory obligations.

Facilitate the conservation of bat populations and other protected species.

*Adapted from 'Defining aims and objectives', p15 BCT Bat Surveys - Good Practice Guidelines,

Survey methodology

The survey methodology follows the recommended guidelines published by the Bat Conservation Trust - Bat Surveys: Good Practice Guidelines, 2nd Edition, Hundt, L (2012), Natural England (Survey Objectives, Methods and Standards as outlined in the Bat Mitigation Guidelines, 2004) and Chapter 3 - Survey and Monitoring Methods, (Bat Worker's Manual, JNCC, Mitchell-Jones AJ and McLeish, AP, 3rd Edition 2004).

The survey protocol requires that a full visual inspection of the property is carried out. The survey aims to cover all internal and external features of the building including any accessible roof voids and out-buildings that are likely to be affected by the proposed works. The main purpose of the search is to look for evidence of flight, feeding, perching or other indicative signs of bat activity or evidence of other protected species at the property.

The search was made using a high-powered lamp (Clu-lite CB2 - 1,000,000 candle power), close-focussing binoculars (Swarovski Optik EL8 x 32 WB) and digital camera (Sony Cyber-shot HX300) were used to view all likely areas of the building for the presence of bats - ie. droppings and urine spots, bat corpses, bat fly larvae, roost staining or evidence of feeding remains such as discarded moth and butterfly wings or other insects fragments typically found in a perching and feeding area.

Non-invasive survey methods were used to assess the use of the property by protected species.

Survey limitations

The survey is designed to determine the likely presence of bats and does not necessarily prove their absence.

Crevice-roosting bat species are able to roost within very narrow gaps, frequently less than 25mm wide; solitary roosting bats are sometimes overlooked during daylight inspections, particularly in situations where bats have gained access within rubble infill walls or beneath roof materials and other structural features.

Evidence of bat activity such as bat droppings, feeding signs and other indicative evidence such as staining on external walls and surfaces is frequently removed by the action of wind and rain – please note that absence of evidence of bats is not necessarily evidence that bats are not present.

Records whilst indicative of the bat species likely to occur within an area, do not confirm presence or absence of a species or habitat. Some local records may contain unverified public data.

Proposed works

A proposed two storey side extension requiring some modifications to an existing roof verge and fascia soffit.

Pre-existing information

A data search has found no records of roosting bats at this property or within neighbouring dwellings.

The location is sub-optimal in terms of connectivity and access to high-value feeding, foraging and commuting habitat for bats.

Pre-survey data search

The aim of the pre-survey data search is to collate background information about the proposed development site on bat activity, roosts and significant landscape features that may be used by bats and other protected species. Information sources include:

- (1) European Protected Species (EPS) ie. species records of local, regional or national significance.
- (2) National Biodiversity Network (NBN)* terrestrial mammal records (chiroptera).
- (3) Local bat records: (i) East Lancashire Bat Group (ELBG) (ii) EED Surveys (iii) other ecological consultants.

The following bat species are recorded within the 10km national grid square: SD63 (Ribble Valley - west):

Status of local population Scientific name Common name widespread/common (Myotis nattereri) 1 2 Natterer's bat widespread (M. mystacinus) * 1 Whiskered bat widespread (M. brandtii)2 Brandt's bat widespread/locally common (M. daubentonii) * 1 2 Daubenton's bat widespread/locally common (Plecotus auritus)* 1 2 Brown long-eared bat (Pipistrellus pipistrellus)* 1 2 widespread/common Common pipistrelle widespread/locally common (P. pygmaeus)* 1 2 Soprano pipistrelle widespread but local (Nyctalus noctula)12 Noctule bat ³Bowland Kilns and Caves Research Group ²EED surveys *NBN data 1East Lancashire Bat Group

Location of the property

NGR: SD 640 304 Elevation: 115 metres

The property is located at the junction of the Branch Road, Mellor Brook and Preston New Road (A677). The location is semi-urban in character, situated relatively close to a well-established residential development.

The rear elevation of the house and large rear garden is adjacent to extensive permanent grazing land and open countryside to the east and south-east.

There are no extensive areas of broadleaved woodland or plantation within 1km of the site and there are no significant areas of standing open water, riparian woodland or river channel nearby. There is some riparian woodland at nearby Mellor Brook approximately 400 metres north of the property, however the location is considered to be sub-optimal in terms of connectivity to high-value feeding, foraging and commuting habitat for bats.

A local data search has shown there are no designated nature conservation sites immediately adjacent to the property ie. Special areas of Conservation (SACs), Sites of Special Scientific Interest (SSSI), Biological Heritage Sites (BHS), National Nature Reserves (NNR's), Local Nature Reserves (LNR's) or Regionally Important Geological and Geo-morphological Sites (RIGS).

Description of the property

The property is a detached two storey house with standard brick cavity wall construction and duo-pitched roof (figures 1). The rafter-with-purlin roof is lined with bitmastic felt and clad in concrete tiles; the central part of the roof void is underdrawn with fibre board (figure 3) and the floor is boarded for access. Eaves voids to the front and rear of the roof (figures 4 and 5) are insulated with a glass fibre thermal material. The voids are clean, dry and well-ventilated and there are no signs of access by roosting bats or nesting wild birds.

To the side of the property (south elevation) is a single storey extension with mono-pitched tiled roof. All external brickwork to the property is well-sealed and the PVC fascia-soffits, lead work flashings and dry verges are very well-sealed and completely secure (figure 6).

The house is double-glazed throughout and all external building features are well-maintained and very secure.

A single storey double garage is situated close to the north elevation (figures 7 and 8); the building has a duo-pitched tiled roof lined with bitumen felt; there are single-glazed windows to the rear providing good natural light. To the front of the garage is an up-and-over alloy door (figure 8).

The building is well-maintained and secure and there are no signs of access by roosting bats or wild birds.

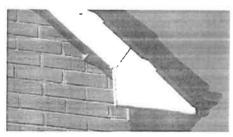

Figure 4:

Figure 5:

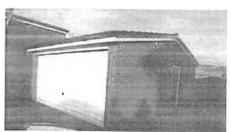

Figure 6:

Figure 7:

Figure 8:

Survey results

A preliminary roost assessment has found no evidence of roosting, perching or feeding bats at the property.

There are no signs of roosting bats within the main roof void, eaves voids or detached garage.

The surveyor has found no historical evidence that bats have ever been present at this site.

There are no records of bats at this site; the location is sub-optimal with low connectivity to high quality habitat.

The property has low conservation significance in terms of access to roosting bats or nesting wild birds.

Evaluation of results

The building has low roosting potential for bats; it is unlikely that bats have been present in either building.

The proposed building operations are unlikely to result in disturbance to roosting bats or nesting wild birds.

The impact of the proposed works on protected species is likely to be minimal.*

Impact assessment

*Minimal: it is highly unlikely any bat species have been active within any part of the property.

*Low risk: there is only low risk of disturbance to solitary bats or small numbers of common and widespread bat species.

Low / moderate risk: caution required; activity of common / rarer species is possible, including the presence of occasional / regular night perching and feeding activity or the presence of small numbers of rarer species (but not a maternity or hibernation site).

Moderate risk: caution required; there is moderate risk of disturbance to common bat species; activity may include the presence of regular / significant feeding perches and signs of feeding, a regularly used day / night roost or a maternity site of a common and widespread species or the likely presence of low numbers of rarer species ('rarer' as defined within the local context).

Moderate / high risk: considerable caution is required; this category may include a maternity site of rarer species.

<u>High risk</u>: considerable / extreme caution is required; there is a significant risk of causing disturbance to roosting bats at this site including large numbers of common species, a maternity site of locally rare or rarest UK species or a significant hibemation site for rare or rarest species; this is likely to be a site meeting the SSSI guidelines.

Summary and recommendations

BATS

Minimal – low impact.

The proposed building alterations and disturbance to roof areas are unlikely to cause disturbance to bats or result in the loss of a bat roost or cause injury or death of a European Protected Species.

It is recommended the works proceed without a requirement to obtain a development licence (EPSL) since the proposed development is unlikely to result in a breach of the Habitats Regulations.

Further survey effort at the property is not required.

Nesting wild birds

There is no risk of disturbance to nesting wild birds.

ANNEX 1

Mitigation guidance

Action	Summary of advice / recommendations
1. Timing constraints	Not required
2. Further survey effort at this site	Not required
3. Detailed method statement	Not required
4. Licence requirement (EPSL)	Not required
5. Disturbance to roof materials:	Minimal / low risk of disturbing roosting bats. In the unlikely event of any bats being exposed during the removal of the roof spars, tiles, timber battens or lead flashings, building operations should cease in the area of disturbance until the property has been inspected by a licenced person.
6. Accidental disturbance to bats	Seek advice immediately. Cover any exposed bats to reduce any further risk of harm. Place the bats in a small dark and very secure box and leave in a cool and quiet place. Wherever possible, building / roofing contractors should try to prevent any bats from flying away in daylight. Call the surveyor for further advice before proceeding, otherwise contact the emergency help line at the BCT.
7. Legal responsibility	The onus lies with the applicant to ensure that no offence will be committed if the development goes ahead, regardless of whether planning permission is granted.
8. Emergency advice on bats	EED Surveys (David Fisher): 01200 425113 (office) or 07709 225783 (mobile) email:earthworksuk@yahoo.co.uk

The Bat Conservation Trust (BCT) provides a bat helpline: 0345 1300 228; in an emergency, BCT will call the nearest volunteer bat worker in your area to arrange a site visit.

ANNEX 2

Wildlife legislation - Bats and the law

All bat species in the UK receive full protection under the Wildlife and Countryside Act 1981 (amended by the Environment Protection Act 1990). The Countryside and Rights of Way Act 2000 amends the Wildlife and Countryside Act to also make it an offence to intentionally or recklessly damage, destroy or obstruct a place that bats use for shelter or protection. All species of bats are listed on Schedule 5 of the 1981 Act, which makes it an offence to:

intentionally kill, injure or take any wild bat.

 intentionally or recklessly damage, destroy or obstruct access to any place that a wild bat uses for shelter or protection. This is taken to mean all bat roosts whether bats are present or not.

• intentionally or recklessly disturb any wild bat while it is occupying a structure or place which it uses for shelter or protection.

The protected status afforded to bats means planning authorities may require extra information (in the form of surveys, impact assessments and mitigation proposals) before determining planning applications for sites used by bats. Planning authorities may refuse planning permission solely on grounds of the predicted impact on protected species such as bats. Recent case law has underlined the importance of obtaining survey information prior to the determination of planning consent¹.

"It is essential that the presence or otherwise of protected species, and the extent that they may be affected by a development proposal, is established before the planning permission is granted, otherwise all relevant material considerations may not have been addressed in making the decision." ²

All British bat species are included in Schedule 2 of the Conservation (Natural Habitats, &c.) (Amendment) Regulations 2007, (also known as Habitats Regulations) which defines 'European Protected Species' (EPS).

¹ Bat Mitigation Guidelines, AJ Mitchell Jones, Joint Nature Conservation Committee, (2004) ISBN 1 86107 558 8

Planning Policy Statement (PPS9) (2005), Biodiversity and Geological Conservation. ODPM.

Protected species (Bats) and the planning process

Our built environment has the potential to have major negative impacts on biodiversity. However, if done sensitively, the development and refurbishment of buildings can, in fact, increase the ecological value of the site.*

For development proposals requiring planning permission, the presence of bats, and therefore the need for a bat survey, is an important 'material planning consideration'. Adequate surveys are therefore required to establish the presence or absence of bats, to enable a prediction of the likely impact of the proposed development on them and their breeding sites or resting places and, if necessary, to design mitigation and compensation. Similarly, adequate survey information must accompany an application for a Habitats Regulations licence (also known as a Mitigation Licence) required to ensure that a proposed development is able to proceed lawfully¹.
