

### **Grasscrete specification and construction system**

The chosen system is Grid Force. The system is based on interlocking cellular grids layed over a prepared stone and sand surface, filled with topsoil and seeded with hard wearing festuca and creeping bent grasses.

The system will deliver a permeable protected grass surface which can be mown when required and is capable of supporting heavy traffic. The system does not rely on concrete or tarmac. The appearance is of a grass field.

The works will be carried out by Holden Clough Landscapes. The company have extensive groundworks experience and have used the Grid Force system on many projects.

See attached detailed manufacturer's technical construction advice.

A showing the system being layed is available online:
