

# **Preliminary Bat Roost Assessment Report**

**1 George Street,  
Whalley,  
BB7 9TH**

**24.09.2021**

**Report prepared by:  
Dave Anderson  
Batworker.com**

## **Summary**

In August 2021 Batworker consultancy was commissioned to undertake a survey of 1 George Street, Whalley, BB7 9TH to assess the potential for use by bats and breeding birds.

A daytime survey was carried out on 19<sup>th</sup> August 2021 to support residential development plans. This was supported by an emergence survey.

**No evidence was recorded to suggest bats were roosting within the building.**

**No bats were observed or recorded using the building for roosting.**

**The building is considered to be of negligible potential for roosting bats.**

**The surveyor considers survey effort to be reasonable to assess the roost potential of the building and no further survey work is deemed appropriate.**

**The surveyor does not consider the proposed development and change of use is likely to result in a breach of the Conservation (Natural Habitats &c.) Regulations 1994 (as amended) therefore the proposed development does not require an EPS Licence (EPSL) to proceed lawfully.**

## Introduction

In August 2021 Batworker consultancy was commissioned to undertake a survey of 1 George Street, Whalley, BB7 9TH to assess the potential for use by bats and breeding birds.

A daytime survey was carried out on 19<sup>th</sup> August 2021 to support residential development plans. This was supported by an emergence survey.

## Survey and Site Assessment

### Objectives of the survey

The survey was carried out to determine roost potential of the building, current usage by bats, and other protected species, of the site and to establish status of the bat species using the site prior to development work being carried out.

### Survey site location

A central grid reference for the site is SD7328836244

## Site Description

The property consists of a detached two storey brick built built former co-operative building with a hipped slate roof. The property has a complex of single storey flat and single and double pitched roofed extensions to the rear. External walls are pointed with no obvious cavities, cracks, gaps or crevices present. The gables are well sealed.

Roof slates are generally close fitting with no obvious areas of lifted, slipped or missing slates present. The ridge is pointed and well sealed. A dormer is present to the frontage.

The building can be considered to offer low roosting bat potential.

## **Pre Existing data on local bat species**

A search of the MAGIC ([www.magic.gov.uk](http://www.magic.gov.uk)) website revealed no EPS licence applications within a 1km radius.

The surveyor holds records of soprano and common pipistrelle, brown long eared and daubenton's bat roosts within 1km.

From personal experience of surveying for and researching bats in Lancashire, Yorkshire and Cumbria, the following species were considered.

Common Pipistrelle – known to roost on sites where suitable foraging habitat is available.

Soprano Pipistrelle – known to roost on sites where suitable foraging habitat is available.

Whiskered/Brandt's – species often found roosting in buildings close to woodland.

Natterer's – a typical upland bat with foraging bats being recorded high on heather moorland. Often roosting in barns.

Daubenton's – a species commonly associated with aquatic habitats.

Long Eared bat – a woodland species which has been recorded foraging over in bye meadows and rough grassland sites. Often roosting in barns.

The site falls within a risk impact zone for the South Pennines Site of Special Scientific Interest/Special Protection Area, however the development does not fall within a relevant risk impact category.

## Habitat

The property is located in the urban centre of Whalley with surrounding habitat dominated by mature domestic gardens, amenity grassland and mature deciduous tree cover. The River Calder and associated riparian woodland is located 200m to the south of the property.

Connectivity to the wider landscape is good.

Bat foraging potential is moderate.

## **Field Survey Methodology**

### **Visual inspection**

An inspection was carried out to search for and identify potential feeding perches, roosting opportunities and signs of bat use both internally and externally. The visual inspection focussed on searching for feeding remains and bat droppings both within the building and on external walls. Crevices and other potential roost sites were investigated for smear/grease marks, lack of cobwebs, urine staining.

Equipment used included:

- ! Lupine Pico LED torch
- ! SeeSnake CA 300 video endoscope
- ! Opticron close focusing binoculars

### **Personnel**

All surveys were conducted by Dave Anderson MSc, Natural England Science, Education and Conservation bat licence holder (2015-15784-CLS-CLS) a bat surveyor and ecologist with over 20 years experience.

### **Survey Summary**

<b>Survey</b>	<b>Date</b>	<b>Timings</b>
Visual	19.08.2021	1 Hour
Emergence Survey	05.09.2021	3 Hours

### **Survey constraints**

Access to all areas of the exterior of the buildings was possible and good visual inspection at ground level was possible. Evidence of bat activity such as bat droppings or staining on external walls and surfaces is frequently removed by the action of wind and rain; apparent absence of evidence is therefore evaluated with caution. In many situations it is not possible to inspect every locations where bats are present therefore it should be assumed that an absence of bat evidence does not necessarily equate to evidence that bats are absent.

Some species such as pipistrelle sp bats are opportunistic and it is possible for individuals to be found during works, even where surveys have had negative results during preliminary and activity surveys. Due to current Covid19 restrictions and IUCN BSG advice to batworkers no internal inspection was carried out, however given the general well sealed nature of the building this was not considered a constraint.

## **Survey Results**

### **Visual Inspection - Bats**

The property was assessed as offering low roosting potential with no obvious gaps or crevices suitable for roosting bats. The building is generally well sealed.

No physical evidence of bats grease marks or urine splashing was recorded on, in or around the buildings despite suitable horizontal surfaces being present and undisturbed.

No evidence of roosting bats was observed on the exterior of the buildings.

### **Emergence Survey - 5<sup>th</sup> September 2021**

**Start: 19.35 Sunset: 19.53 Finish: 21.15**

An emergence survey on 5<sup>th</sup> September 2021 was carried out with surveyors using a combination of Anabat Walkabout and Anabat Scout full spectrum bat detectors and a Canon XA25 nightshot video camera with Infrared illuminators. Calls were analysed post survey using Anabat Insight software.

The property has considerable street light present to the frontage of the building, however dark corridors are present to the rear. Bat activity throughout the survey period was very low, characterised by low numbers of distant soprano pipistrelle bat passes along tree cover to the west and south of the property.

No bats were observed emerging from the building.

### **Visual Inspection – Nesting birds**

No evidence of nesting birds was recorded.

### **Evaluation of the results**

No evidence of use by bats was recorded during the survey and the building was assessed as offering negligible to low roosting potential due to a lack of potential roosting features and the general well sealed nature of the property.

During an emergence survey no bats were recorded emerging from the building and only distant low levels of foraging soprano pipistrelle bats were recorded along tree cover to the west and south of the property. The presence of street lighting is likely to have a negative effect on bat activity.

Given the lack of roosting potential it is considered that the development proposals do not risk negative impacts on roosting bats.

## **Conclusion**

**No evidence was recorded to suggest bats were roosting within the building.**

**No bats were observed or recorded using the building for roosting.**

**The building is considered to be of negligible potential for roosting bats.**

**The surveyor considers survey effort to be reasonable to assess the roost potential of the building and no further survey work is deemed appropriate.**

**The surveyor does not consider the proposed development and change of use is likely to result in a breach of the Conservation (Natural Habitats &c.) Regulations 1994 (as amended) therefore the proposed development does not require an EPS Licence (EPSL) to proceed lawfully.**

## **Proposed Biodiversity Net Gain**

The installation of a Greenwoods Ecohabitats Two Chamber Bat Box or Kent Bat Box within the site would provide roosting potential for the local bat population.

## **Accidental exposure of bats - EMERGENCY ADVICE**

In the unlikely event of bats or their roosts being exposed or vulnerable to harm, suspend further work in that area. Cover the exposed bats to reduce any further risk of harm and seek advice immediately.

Call Dave Anderson (Batworker) on [REDACTED]; a site visit will be arranged to assess the situation and recover any bats / safely remove them from site.

## **Bats and the Law**

**Wildlife and Countryside Act 1981**, principally those relating to powers and penalties, have been amended by the Countryside and Rights of Way Act 2000 (CRoW Act). The CRoW Act only applies to England and Wales.

### **Section 9(1)**

It is an offence for any person to intentionally kill, injure or take any wild bat.

### **Section 9(4)(a)**

It is an offence to intentionally or recklessly\* damage, destroy or obstruct access to any place that a wild bat uses for shelter or protection.

(\*Added by the CRoW Act in England and Wales only)

This is taken to mean all bat roosts whether bats are present or not.

### **Section 9(4)(b)**

It is an offence to intentionally or recklessly\* disturb any wild bat while it is occupying a structure or place that it uses for shelter or protection.

(\*Added by the CRoW Act in England and Wales only)

## **The Conservation (Natural Habitats, &c.) Regulations 1994**

### **Section 39(1)**

It is an offence

(a) deliberately to capture or kill any bat

(b) deliberately to disturb any bat

(d) to damage or destroy a breeding site or resting place of any bat.

The difference between this legislation and the Wildlife and Countryside Act 1981 is the use of the word 'deliberately' rather than 'intentionally'. Also disturbance of bats can be anywhere, not just at a roost. Damage or destruction of a bat roost does not require the offence to be intentional or deliberate.

## **Countryside and Rights of Way (CROW) Act (2000)**

### **Part III Nature conservation and wildlife protection**

#### **74 Conservation of biological diversity**

(1) It is the duty of (a) any Minister of the Crown (within the meaning of the Ministers of the [1975 c. 26.] Crown Act 1975), (b) any Government department, and (c) the National Assembly for Wales, in carrying out his or its functions, to have regard, so far as is consistent with the proper exercise of those functions, to the purpose of conserving biological diversity in accordance with the Convention.

### **SCHEDULE 12 AMENDMENTS RELATING TO PART I OF WILDLIFE AND COUNTRYSIDE ACT 1981**

1. In section 1(5) of the 1981 Act (offence of intentional disturbance of wild birds) after "intentionally" there is inserted "or recklessly".

## **The Natural Environment and Rural Communities Act (2006)**

### **PART 3, (40): Duty to conserve biodiversity**

(1) Every public authority must, in exercising its functions, have regard, so far as is consistent with the proper exercise of those functions, to the purpose of conserving biodiversity.

(3) Conserving biodiversity includes, in relation to a living organism or type of habitat, restoring or enhancing a population or habitat.
