  - c. 1 in 30 Year (Surcharged Outfall)
  - d. 1 in 100 Year + 30% Climate Change
  - e. Foul Water Design

## 1. Introduction

The following document has been prepared to assist the designer's preparation and the readers understanding of the drainage theory and calculations in one reference document.

This document covers all Phases 1, 2 & 3 of the Chipping Lane development, in order to demonstrate how the full site drains; supporting evidence has been provided.

## 2. Site Details

Development Name	Chipping Lane
Site Address	Land off Chipping Lane, Longridge, Preston, PR3 2NA
Longitude, Latitude (or OS Grid Ref)	360321; 437929
Site Description	7 No. open grassed fields separated by mature hedgerows and sporadic trees. Currently used by livestock for grazing.
Site Area (Ha)	14.41Ha approx.
Site Area used for calculating Greenfield Runoff Rates (Ha)	10.52Ha approx. This excludes large areas of open spaces
Existing Impermeable Area (Ha)	0Ha
Is the Site Steeply Sloping (Y/N), If "Yes" Typical Gradient.	Yes 1:30

Table 1

## 3. Pre-Development Greenfield Runoff Rates (Phase 1)

A flood risk assessment which covers Phase 1 only, was carried out by Betts Hydro, dated March 2016. This document states that the surface water discharge rate should be restricted to 8.3 l/s/Ha, calculated using the ICP SUDS method within MicroDrainage. This FRA and discharge rate was approved under the planning application 3/2017/0232. See Appendix A for the Full Phase 1 report.

Return Period	Greenfield Rate (l/s/Ha)
1 in 1 year (l/s)	7.2
Qbar	8.3
1 in 30 year (l/s)	14.0
1 in 100 year (l/s)	17.2

Table 2

## 4. Pre-Development Greenfield Runoff Rates (Phases 2 & 3)

A flood risk assessment which covers Phase 2 & 3, was carried out by Betts Hydro, dated December 2018. This document states that the surface water discharge rate should be restricted to 13.6 l/s/Ha, calculated using the HR Wallingford tool for greenfield runoff rates on uksuds.com. This FRA and discharge rate was approved under the planning application 3/2018/0975.

This FRA was revised in November 2021 to include for the new planning layout amendments, for the replan application 3/2021/1134. The drainage strategy and discharge rates emulates the previously approved rate of 13.6 l/s/Ha. See Appendix B for the latest revision of the Full Phases 2 & 3 report.

<b>Return Period</b>	<b>Greenfield Rate (l/s/Ha)</b>
1 in 1 year (l/s)	11.8
Qbar	13.6
1 in 30 year (l/s)	23.1
1 in 100 year (l/s)	28.3

Table 3

## 5. Soakaway Testing

A site specific site investigation was carried out by soiltechnics dated February 2016. A copy of the site investigation is presented in Appendix D.

Ground conditions are typically 0.3m of topsoil overlaying cohesive Devensian Till to beyond depths of 4.7m. The Till is comprised of initially 1-1.5m of low to high strength clay, below which the shear strength increases. Varying amounts of silt, sand and gravel were also found.

2 No. soakway tests were carried out as part of the site investigation. It was considered that the Devensian Till is impermeable and therefore indicates that infiltration drainage is NOT a feasible option.

## 6. Post-Development Surface Water Allowable Discharge Rates (All Phases)

Discharge rates have been limited to existing greenfield runoff rates of Qbar for all storm return periods. Please refer to the phase specific FRA, and Tables 2 and 3 above for details of the greenfield runoff rates.

For the Development Area refer to drawing 459/ED/146.

<b>Phase</b>	<b>Developable Area (Ha)</b>	<b>Greenfield Rate (l/s/Ha)</b>	<b>Allowable Discharge Rate (l/s)</b>
1	4.32	8.3	35.9
2A	1.80	13.6	24.5
2B	2.69	13.6	36.6
3	1.71	13.6	23.2
		<b>TOTAL</b>	<b>120.2</b>

Table 4

Phase 2A is to drain into the existing sewers of Phase 1, these have now been combined into one Network 1, so that they can be modelled together.

<b>Surface Water Network</b>	<b>Developable Area (Ha)</b>	<b>Allowable Discharge Rate (l/s)</b>
Network 1	6.12	60.4
Network 3	2.69	36.6
Network 4	1.71	23.2
	<b>TOTAL</b>	<b>120.2</b>

Table 5

## 7. Design Parameters

M5-60	18.800
Ratio R	0.282
MADD Factor	2.0
Climate Change Allowance	30%
Urban Creep	10%

Table 6

Point of Connection	S14	S325	S415
Engineering Layout Drg No	459/ED/02	459/ED/105	459/ED/105
Proposed Impermeable Areas Drg No	459/ED/04	459/ED/103	459/ED/103
Lowest FFLs	105.175	107.400	111.900
Maximum TWL for Design (Lowest FFL – 0.6m)	104.575	106.800	111.300
Discharge Location Minimum Levels	102.040	106.860	111.120
Surcharge Outfall Levels	102.560	104.400	109.370
Point of Connection	Watercourse		
Point of Connection approved by UU (Y/N)	Yes		

Table 7

## 8. Summary of Drainage Design

The drainage has been designed in accordance with the site specific FRAs produced by Betts Hydro dated March 2016 & November 2021.

The drainage has also been designed to comply with DEFRA's non-statutory technical standard for sustainable drainage systems dated March 2015. Compliance to such is demonstrated within Section 14.

All surface water networks will drain to the adjacent watercourse named Higgin Brook. Discharge rates have been limited to existing greenfield runoff rates of Qbar for all storm return periods.

Attenuation storage is provided in the form of oversized pipes under highways and public open spaces. Attenuation storage in the highways is sized to provide attenuation for all flows up to and including 1 in 30 year storm events.

For storm events exceeding 1 in 30 year events, long term storage is provided in above ground storage areas to ensure no flooding to properties occurs for all storm events up to and including 1 in 100 year 6 hour storm events plus a 30% allowance for climate change.

An allowance of 30% climate change was approved within the FRAs for planning applications 3/2017/0232 and 3/2018/0975, therefore has been adopted for this small replan application.

MicroDrainage simulations are available in Appendix E and demonstrate the Actual Discharge Rates.

Drainage Network	Allowable Discharge Rate (l/s)	Actual Discharge Rate (l/s)	Difference (l/s)
1	60.3	49.9	-10.4
3	36.6	41.8	5.2
4	23.3	26.4	3.1
<b>Total</b>	<b>120.2</b>	<b>118.1</b>	<b>-2.1</b>

Table 8

## 9. Urban Creep

When calculating the proposed impermeable areas for the development, an additional 10% has been added to the areas of domestic properties to represent Urban Creep. This 10% has been applied for all phases; and is shown on the impermeable area plans. These increased areas have been used on all pipe codes within MicroDrainage, in order to design and model the system with greater areas of impermeability. The MicroDrainage calculations are found in Appendix E.

## 10. Design for Exceedance

All surface water drainage models have been modelled for storm events greater than the 1 in 100 year event to determine the impact of flooding. The flood locations are shown on the attached Flood Routing and over land flow drawings. Any exceedance flooding have been demonstrated to be managed within the site where reasonable practicable.

This demonstrates that properties are unlikely to flood during extreme flood events.

## 11. Maintenance

All surface water (coloured blue) on the attached plans, 459/ED/02 and 459/ED/105, will be put forward for adoption under a Section 104 Agreement with United Utilities. Prior to issue of the Vesting Declaration by United Utilities, the drainage shown on the included plan will be maintainable by Barratt Manchester at the expense of Barratt Manchester.

All areas of public open space will be transferred to the management company for adoption and maintenance. This includes the overflow areas/ponds and culverts to the watercourse on the attached plans 459/ED/02 and 459/ED/105. The management and maintenance will be funded by the purchasers/owners of the development by way of an annual fee levied on the owner. In order to ensure the long term operation of the swales, the maintenance contract will stipulate regular maintenance of the SuDS network, in accordance with the management plan.

All highway gullies and highway drains on the attached plan will be put forward for adoption under a Section 38 agreement with Lancashire County Council. After issue of the highway final certificate, the highways and highway drains, gullies and gully pipes on the attached plans 459/ED/02 and 459/ED/105, will be maintainable by the Local Highway Authority at public expense. Prior to the issue of the final certificate by LCC, the roads and drainage will be maintainable by Barratt Manchester at the expense of Barratt Manchester.

All foul drainage (coloured brown) on the attached plans 459/ED/02 and 459/ED/105 will be put forward for adoption under a S104 agreement with United Utilities. Prior to issue of the Vesting Declaration by United Utilities, the drainage shown on the included plan will be maintainable by Barratt Manchester and at the expense of Barratt Manchester.

A draft inspection & maintenance schedule for elements of the SuDS/Drainage infrastructure is shown in Table 9.

<b>Drainage Element</b>	<b>Maintenance Requirement</b>	<b>Frequency</b>
Surface Water Pipes and Manholes (prior to adoption)	Inspect. Remove excess silt & debris, Clear Blockage	Inspect Annually. CCTV if required. Silt & debris removed as necessary.
Catchpits	Inspect. Remove excess silt & debris, Clear Blockage	Inspected every 3 months. Silt & debris removed as necessary.
Ditches/Swales	Inspect. Remove excess vegetation. Clear blockages, silt & debris.	Inspected every 1 Month. Blockages, silt & debris removed as necessary.
Flow Controls	Inspect. Remove excess silt & debris, clear blockage. Test functionality of Bypass doors.	Inspect Annually Silt & debris removed as necessary. Flow control repaired, maintained as necessary.
Overflow Ponds (and POS)	Inspect. Remove excess vegetation. Clear blockages, silt & debris.	Inspected monthly, or after significant storm events. Blockages, silt & debris removed as necessary.

Table 9

Culverting sections of the existing watercourse may create or exacerbate upstream or downstream bank and bed erosion as well as sediment deposition, as a result of altered water velocities and disruption to the natural transport of sediment. In order to reduce the effects of erosion we plan to do the following:

- The culvert base matches the existing bed to allow a naturalised culvert bed during high velocity flows
- The culvert width is the same width as the natural channel
- The soffit of the culvert is greater than the 1 in 1000 year water levels
- Culvert alignment matches the alignment of the watercourse
- The slope of the culvert base matched the slope of the existing bed of the watercourse
- No steps provided between end of headwall and the existing bed of the watercourse

Additional headwalls onto existing watercourse can also create or exacerbate bank and bed erosion as well as sediment deposition. In order to reduce the effects of erosion we plan to do the following:

- Flows have been restricted to mimic Qbar greenfield runoff rates, flows will not be increased
- Outfall structure sits flush with the existing bank to prevent turbulent flows
- Headwalls to be located on straight sections of watercourse
- Headwall alignment to be at angle of 45° to minimise change of flow direction
- Outflow pipes of velocity less than 1.2 m/s
- Height between outlet invert and watercourse bed minimised

Screens/grilles are fitted on all headwalls with pipes 375mm or greater. Screens serve two purposes: a trash screen to prevent floating debris and a security screen to restrict access from unauthorised people. Screens are fitted with 100mm spacings between bars so as not to hinder passage of fish and other fauna. The maintenance of screens is safer and easier than clearing potential blockages within the culverts themselves. Maintenance will be in line with that described in Table 6.

## 12. Defect Reporting

Prior to adoption of the highway drains, foul drains, surface water drains, SuDS and culverts, defects may be reported to Barratt Manchester by the local authority, local residents or members of the public.

All defects can be reported to Barratt Manchester Customer Care line using the following details:

Email: [manchester@newhomecare.co.uk](mailto:manchester@newhomecare.co.uk)

Phone: 0161 872 0161 Option 3

Phone (Out-of-Hours): 0345 601 6084

The customer care line's normal working hours are Monday to Friday 9:00 to 17:30, excluding bank holidays. The out-of-hours line is a 24-hour call service.

After adoption, the following numbers may be useful:

Management Company

POS Landcare Ltd  
Hillhouse Business Park,  
Thornton Cleveleys,  
Lancashire  
FY5 4QD

Tel: 01253 897 824

Lancashire County Council Highways

[www.lancashire.gov.uk/roads-parking-and-travel/report-it/](http://www.lancashire.gov.uk/roads-parking-and-travel/report-it/)

Tel: 0300 123 6780 (Mon-Fri 8:00 to 17:00, exc. Bank Holidays)

United Utilities

Tel: 0345 672 3723

Environment Agency

Tel: 0800 80 70 60 (24 Hours)

## 13. Response Times

All non-urgent defects will be repaired within 10 weeks of being reported.

All urgent defects will be made safe within 48 hours, or sooner if practicable. Any works to 'Make Safe' may be a temporary measure in order to protect the public, and allow sufficient time to procure the permanent remedial works. This may include temporary 'fencing off' of the hazard until permanent remedial works can be completed.

United Utilities, Local Authority, Environment Agency, and the Management Company may operate to alternative response times.

Refer to the site landscape maintenance schedule for further details on the site wide schedule.

## 14. Compliance with DEFRA's Non-Statutory Technical Standards for Sustainable Drainage Systems dated March 2015

### Flood risk outside the development

Criteria	Designers Comments
<b>S1</b> Where the drainage system discharges to a surface water body that can accommodate uncontrolled surface water discharges without any impact on flood risk from that surface water body (e.g. the sea or a large estuary) the peak flow control standards ( <b>S2</b> and <b>S3</b> below) and volume control technical standards ( <b>S4</b> and <b>S6</b> below) need not apply.	The surface water discharges to existing watercourse/sewer, therefore this criteria does not apply.

### Peak flow control

Criteria	Designers Comments
<b>S2</b> For greenfield developments, the peak runoff rate from the development to any highway drain, sewer or surface water body for the 1 in 1 year rainfall event and the 1 in 100 year rainfall event should never exceed the peak greenfield runoff rate for the same event.	All proposed discharge rates are less than or equal to Qbar. Therefore this criteria is deemed to comply.
<b>S3</b> For developments which were previously developed, the peak runoff rate from the development to any drain, sewer or surface water body for the 1 in 1 year rainfall event and the 1 in 100 year rainfall event must be as close as reasonably practicable to the greenfield runoff rate from the development for the same rainfall event, but should never exceed the rate of discharge from the development prior to redevelopment for that event.	The site is greenfield therefore not applicable. Therefore, this criteria is deemed to comply.

### Volume control

Criteria	Designers Comments
<b>S4</b> Where reasonably practicable, for greenfield development, the runoff volume from the development to any highway drain, sewer or surface water body in the 1 in 100 year, 6 hour rainfall event should never exceed the greenfield runoff volume for the same event.	As the infiltration test results do not allow infiltration drainage, it is not possible to reduce the run-off volume to the greenfield volume, therefore Criteria S6 will apply.

<p><b>S5</b> Where reasonably practicable, for developments which have been previously developed, the runoff volume from the development to any highway drain, sewer or surface water body in the 1 in 100 year, 6 hour rainfall event must be constrained to a value as close as is reasonably practicable to the greenfield runoff volume for the same event, but should never exceed the runoff volume from the development site prior to redevelopment for that event.</p>	<p>The site is Greenfield therefore not applicable.</p>
<p><b>S6</b> Where it is not reasonably practicable to constrain the volume of runoff to any drain, sewer or surface water body in accordance with <b>S4</b> or <b>S5</b> above, the runoff volume must be discharged at a rate that does not adversely affect flood risk.</p>	<p>As the infiltration test results do not allow infiltration drainage, it is not possible to reduce the run-off volume to the greenfield volume, therefore the discharge rate has been reduced to a maximum of Qbar for all rainfall events up to and including 1 in 100 year 6 hour event.</p>

### Flood risk within the development

Criteria	Designers Comments
<p><b>S7</b> The drainage system must be designed so that, unless an area is designated to hold and/or convey water as part of the design, flooding does not occur on any part of the site for a 1 in 30 year rainfall event.</p>	<p>The drainage system has been designed to ensure no flooding occurs for any part of the site for a 1 in 30 year event. Micro drainage simulation for a 1 in 30 year event are attached in Appendix D</p>
<p><b>S8</b> The drainage system must be designed so that, unless an area is designated to hold and/or convey water as part of the design, flooding does not occur during a 1 in 100 year rainfall event in any part of: a building (including a basement); or in any utility plant susceptible to water (e.g. pumping station or electricity substation) within the development.</p>	<p>The drainage system has been designed to ensure no flooding to properties occurs for any part of the site for a 1 in 100 year 6 Hour event. For flows in excess of the 1 in 30 year event, flows are allowed to overflow into Long Term Storage areas located in public open spaces.</p> <p>Some minor flooding to highways is accepted for the 1 in 100 year 6 hour event. Flooding is only permitted where it can be demonstrated that minor flooded is contained wholly within the adopted highway and will not flood properties. The location and flood extent are shown on the Flood Routing and Overland Flow drawing.</p> <p>Micro drainage simulation for a 1 in 100 year event are attached in Appendix D</p>

<b>S9</b> The design of the site must ensure that, so far as is reasonably practicable, flows resulting from rainfall in excess of a 1 in 100 year rainfall event are managed	All surface water drainage models have been modelled for storm events greater than the 1 in 100 Year event to determine the impact of flooding. The Flood locations are shown on the attached Flood Routing and over land flow drawing. Any exceedance flooding has been demonstrated to be managed within the site where reasonably practicable.
---	---

### Structural integrity

Criteria	Designers Comments
<b>S10</b> Components must be designed to ensure structural integrity of the drainage system and any adjacent structures or infrastructure under anticipated loading conditions over the design life of the development taking into account the requirement for reasonable levels of maintenance.	All Sewers are to be covered under a S104 agreement with United Utilities for future adoption. All sewers to be built to UU adoptable standards. A 12 month maintenance period is standard with all S104 sewers
<b>S11</b> The materials, including products, components, fittings or naturally occurring materials, which are specified by the designer must be of a suitable nature and quality for their intended use.	All main sewers to be constructed to adoptable standards.  All SUDS to be constructed in accordance with the Typical details as provided.

### Designing for maintenance considerations

Criteria	Designers Comments
<b>S12</b> Pumping should only be used to facilitate drainage for those parts of the site where it is not reasonably practicable to drain water by gravity.	Surface Water Pump Stations are not proposed on this development.  A Foul ONLY Pump Stations is provided only where it is not possible to drain foul by gravity.

### Construction

Criteria	Designers Comments
<b>S13</b> The mode of construction of any communication with an existing sewer or drainage system must be such that the making of the communication would not be prejudicial to the structural integrity and functionality of the sewerage or drainage system.	All Sewers are to be covered under a S104 agreement with United Utilities for future adoption. All sewers to be built to UU adoptable standards.  Connection to the ordinary watercourse will require LLFA land drainage consent. Details of the works have been submitted to the LLFA and subsequently approved. No works to within 8m of an ordinary watercourse will be permitted without LLFA approval.

<p><b>S14</b> Damage to the drainage system resulting from associated construction activities must be minimised and must be rectified before the drainage system is considered to be completed.</p>	<p>All Sewers are to be covered under a S104 agreement with United Utilities for future adoption. All sewers to be built to UU adoptable standards. A 12 month maintenance period is standard with all S104 sewers.</p> <p>Connection to the ordinary watercourse will require LLFA land drainage consent. Details of the works have been submitted to the LLFA and subsequently approved. No works to within 8m of an ordinary watercourse will be permitted without LLFA consent.</p>

#### Online Controls for Surface Network 1

Orifice Manhole: S110, DS/PN: 6.006, Volume (m³): 21.1

Diameter (m) 0.247 Discharge Coefficient 0.600 Invert Level (m) 106.295

Hydro-Brake® Optimum Manhole: S13, DS/PN: 1.012, Volume (m³): 92.9

Unit Reference	MD-SHE-0278-5000-2200-5000
Design Head (m)	2.200
Design Flow (l/s)	50.0
Flush-Flo™	Calculated
Objective	Minimise upstream storage
Application	Surface
Sump Available	Yes
Diameter (mm)	278
Invert Level (m)	102.093
Minimum Outlet Pipe Diameter (mm)	300
Suggested Manhole Diameter (mm)	2100

Control Points	Head (m)	Flow (l/s)
Design Point (Calculated)	2.200	50.0
Flush-Flo™	0.658	49.9
Kick-Flo®	1.428	40.6
Mean Flow over Head Range	-	43.2

The hydrological calculations have been based on the Head/Discharge relationship for the Hydro-Brake® Optimum as specified. Should another type of control device other than a Hydro-Brake Optimum® be utilised then these storage routing calculations will be invalidated

Depth (m)	Flow (l/s)						
0.100	8.7	1.200	46.4	3.000	58.1	7.000	87.6
0.200	28.7	1.400	41.7	3.500	62.6	7.500	90.6

### FOUL SEWERAGE DESIGN

#### Design Criteria for Foul Network 3

Pipe Sizes STANDARD Manhole Sizes STANDARD

Industrial Flow (l/s/ha)	0.00	Add Flow / Climate Change (%)	0
Industrial Peak Flow Factor	0.00	Minimum Backdrop Height (m)	0.200
Flow Per Person (l/per/day)	222.00	Maximum Backdrop Height (m)	1.500
Persons per House	3.00	Min Design Depth for Optimisation (m)	1.200
Domestic (l/s/ha)	0.00	Min Vel for Auto Design only (m/s)	1.00
Domestic Peak Flow Factor	6.00	Min Slope for Optimisation (1:X)	500

Designed with Level Soffits
